Chapter 1. About This Guide

Welcome to the OpenNMS Horizon Administrators Guide. This documentation provides information and procedures on setup, configuration, and use of the OpenNMS Horizon platform. Using a task-based approach, chapters appear in a recommended order for working with OpenNMS Horizon:

1. **Opt in or out** of usage statistics collection (requirement during first login).
2. **Setup the admin user**.
3. **Create users** and security roles.
4. **Provision** your system.

### 1.1. Audience

This guide is suitable for administrative users and those who will use OpenNMS Horizon to monitor their network.

### 1.2. Related Documentation

**Installation Guide:** how to install OpenNMS Horizon

**Developers Guide:** information and procedures on developing for the OpenNMS Horizon project

**OpenNMS 101:** a series of video training tutorials that build on each other to get you up and running with OpenNMS Horizon

**OpenNMS 102:** a series of stand-alone video tutorials on OpenNMS features

**OpenNMS Helm:** a guide to OpenNMS Helm, an application for creating flexible dashboards to interact with data stored by OpenNMS

**Architecture for Learning Enabled Correlation (ALEC):** guide to this framework for logically grouping related faults (alarms) into higher level objects (situations) with OpenNMS.

### 1.3. Typographical Conventions

This guide uses the following typographical conventions:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>bold</strong></td>
<td>Indicates UI elements to click or select in a procedure, and the names of UI elements like dialogs or icons.</td>
</tr>
<tr>
<td><strong>italics</strong></td>
<td>Introduces a defined or special word. Also used for the titles of publications.</td>
</tr>
<tr>
<td><strong>code</strong></td>
<td>Anything you must type or enter, and the names for code-related elements (classes, methods, commands).</td>
</tr>
</tbody>
</table>
1.4. Need Help?

- join the OpenNMS Discussion chat
- join our community on Discourse
- contact sales@opennms.com to purchase customer support
Chapter 2. Data Choices

The first time a user with the Admin role logs into the system, a prompt appears for permission to allow the Data Choices module to collect and publish anonymous usage statistics to https://stats.opennms.org.

The OpenNMS Group uses this information to help determine product usage, and improve the OpenNMS Horizon software.

Help Improve OpenNMS

Please opt-in to send anonymous OpenNMS usage statistics to OpenNMS Statistics. This will help us improve your OpenNMS software, subject to our privacy policy. You can change this setting at any time from the Admin menu.

Show me what is being sent.

Opt-in Opt-out

Click Show me what is being sent to see what information is being collected. Statistics collection and publication happen only once an admin user opts-in.

When enabled, the following anonymous statistics are collected and published on system startup and every 24 hours after:

- System ID (a randomly generated UUID)
- OpenNMS Horizon Release
- OpenNMS Horizon Version
- OS Architecture
- OS Name
- OS Version
- Number of alarms in the alarms table
- Number of events in the events table
- Number of IP interfaces in the ipinterface table
- Number of nodes in the node table
- Number of nodes, grouped by System OID

You can enable or disable usage statistics collection at any time by choosing admin>Configure OpenNMS>Additional Tools>Data Choices and choosing Opt-in or Opt-out in the UI.
Chapter 3. User Management

Users are entities with login accounts in the OpenNMS Horizon system. Ideally each user corresponds to a person. An OpenNMS Horizon User represents an actor which may be granted permissions in the system by associating Security Roles. OpenNMS Horizon stores by default User information and credentials in a local embedded file based storage. Credentials and user details, e.g. contact information, descriptions or Security Roles can be managed through the Admin Section in the Web User Interface.

Beside local Users, external authentication services including LDAP / LDAPS, RADIUS, and SSO can be configured. Configuration specifics for these services are outside the scope of this section.

The following paragraphs describe how to manage the embedded User and Security Roles in OpenNMS Horizon.

3.1. Users

Managing Users is done through the Web User Interface and requires to login as a User with administrative permissions. By default the admin user is used to initially create and modify Users. The User, Password and other detail descriptions are persisted in users.xml file. It is not required to restart OpenNMS Horizon when User attributes are changed.

In case administrative tasks should be delegated to an User the Security Role named ROLE_ADMIN can be assigned.

- Don’t delete the admin and rtc user. The RTC user is used for the communication of the Real-Time Console on the start page to calculate the node and service availability.
- Change the default admin password to a secure password.

How to set a new password for any user

1. Login as a User with administrative permissions
2. Choose Configure OpenNMS from the user specific main navigation which is named as your login user name
3. Choose Configure Users, Groups and On-Call roles and select Configure Users
4. Click the Modify icon next to an existing User and select Reset Password
5. Set a new Password, Confirm Password and click OK
6. Click Finish to persist and apply the changes

How users can change their own password

1. Login with user name and old password
2. Choose Change Password from the user specific main navigation which is named as your login user name
3. Select **Change Password**
4. Identify yourself with the old password and set the new password and confirm
5. Click **Submit**
6. Logout and login with your new password

**How to create or modify user**
1. Login as a **User** with administrative permissions
2. Choose **Configure OpenNMS** from the user specific main navigation which is named as your login user name
3. Choose **Configure Users, Groups and On-Call roles** and select **Configure Users**
4. Use **Add new user** and type in a **login name** as **User ID** and a **Password** with confirmation or click **Modify** next to an existing **User**
5. **Optional**: Fill in detailed **User Information** to provide more context information around the new user in the system
6. **Optional**: Assign **Security Roles** to give or remove permissions in the system
7. **Optional**: Provide **Notification Information** which are used in **Notification** targets to send messages to the **User**
8. **Optional**: Set a schedule when a **User** should receive **Notifications**
9. Click **Finish** to persist and apply the changes

Please note that angle brackets (<>), single (’) and double quotation marks (“), and the ampersand symbol (&) are not allowed to be used in the user ID.

By default a new **User** has the **Security Role** similar to **ROLE_USER** assigned. Acknowledgment and working with **Alarms** and **Notifications** is possible. The **Configure OpenNMS** administration menu is not available.

**How to delete existing user**
1. Login as a **User** with administrative permissions
2. Choose **Configure OpenNMS** from the user specific main navigation which is named as your login user name
3. Choose **Configure Users, Groups and On-Call roles** and select **Configure Users**
4. Use the trash bin icon next to the **User** to delete
5. Confirm delete request with **OK**

### 3.2. Security Roles

A **Security Roles** is a set of permissions and can be assigned to an **User**. They regulate access to the Web User Interface and the **ReST API** to exchange monitoring and inventory information. In case of a distributed installation, the **Minion** or **Remote Poller** instances interact with **OpenNMS Horizon** and require specific permissions which are defined in the **Security Roles ROLE_MINION** and
The following Security Roles are available:

<table>
<thead>
<tr>
<th>Security Role Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>anyone</td>
<td>In case the opennms-webapp-remoting package is installed, any user can download the Java Webstart installation package for the remote poller from <a href="http://opennms.server:8980/opennms-remoting/webstart/app.jnlp">http://opennms.server:8980/opennms-remoting/webstart/app.jnlp</a>.</td>
</tr>
<tr>
<td>ROLE_ANONYMOUS</td>
<td>Allows HTTP OPTIONS request to show allowed HTTP methods on a ReST resources and the login and logout page of the Web User Interface.</td>
</tr>
<tr>
<td>ROLE_ADMIN</td>
<td>Permissions to create, read, update and delete in the Web User Interface and the ReST API.</td>
</tr>
<tr>
<td>ROLE_ASSET_EDITOR</td>
<td>Permissions to just update the asset records from nodes.</td>
</tr>
<tr>
<td>ROLE_DASHBOARD</td>
<td>Allow users to just have access to the Dashboard.</td>
</tr>
<tr>
<td>ROLE_DELEGATE</td>
<td>Allows actions (such as acknowledging an alarm) to be performed on behalf of another user.</td>
</tr>
<tr>
<td>ROLE_JMX</td>
<td>Allows retrieving JMX metrics but does not allow executing MBeans of the OpenNMS Horizon JVM, even if they just return simple values.</td>
</tr>
<tr>
<td>ROLE_MINION</td>
<td>Minimal amount of permissions required for a Minion to operate.</td>
</tr>
<tr>
<td>ROLE_MOBILE</td>
<td>Allow user to use OpenNMS COMPASS mobile application to acknowledge Alarms and Notifications via the ReST API.</td>
</tr>
<tr>
<td>ROLE_PROVISION</td>
<td>Allow user to use the Provisioning System and configure SNMP in OpenNMS Horizon to access management information from devices.</td>
</tr>
<tr>
<td>ROLE_READONLY</td>
<td>Limited to just read information in the Web User Interface and are no possibility to change Alarm states or Notifications.</td>
</tr>
<tr>
<td>ROLE_REMOTING</td>
<td>Permissions to allow access from a Remote Poller instance to exchange monitoring information.</td>
</tr>
<tr>
<td>ROLE_REST</td>
<td>Allow users interact with the whole ReST API of OpenNMS Horizon</td>
</tr>
<tr>
<td>ROLE_RTC</td>
<td>Exchange information with the OpenNMS Horizon Real-Time Console for availability calculations.</td>
</tr>
<tr>
<td>ROLE_USER</td>
<td>Default permissions of a new created user to interact with the Web User Interface which allow to escalate and acknowledge Alarms and Notifications.</td>
</tr>
</tbody>
</table>

How to manage Security Roles for Users:

1. Login as a User with administrative permissions
2. Choose Configure OpenNMS from the user specific main navigation which is named as your
login user name

3. Choose **Configure Users, Groups and On-Call roles** and select **Configure Users**

4. Modify an existing User by clicking the modify icon next to the User

5. Select the Role from **Available Roles** in the **Security Roles** section

6. Use Add and Remove to assign or remove the **Security Role** from the User

7. Click **Finish** to persist and apply the Changes

8. **Logout** and **Login** to apply the new **Security Role** settings

**How to add custom roles**

- Create a file called `$OPENNMS_HOME/etc/security-roles.properties`.

- Add a property called *roles*, and for its value, a comma separated list of the custom roles, for example:

```
roles=operator,stage
```

- After following the procedure to associate the security roles with users, the new custom roles will be available as shown on the following image:
3.3. Web UI Pre-Authentication

It is possible to configure *OpenNMS Horizon* to run behind a proxy that provides authentication, and then pass the pre-authenticated user to the *OpenNMS Horizon* webapp using a header.

The pre-authentication configuration is defined in `$OPENNMS_HOME/jetty-webapps/opennms/WEB-INF/spring-security.d/header-preauth.xml`. This file is automatically included in the Spring Security context, but is not enabled by default.

DO NOT configure *OpenNMS Horizon* in this manner unless you are certain the web UI is only accessible to the proxy and not to end-users. Otherwise, malicious attackers can craft queries that include the pre-authentication header and get full control of the web UI and ReST APIs.

3.3.1. Enabling Pre-Authentication

Edit the `header-preauth.xml` file, and set the `enabled` property:

```xml
<beans:property name="enabled" value="true"/>
```

3.3.2. Configuring Pre-Authentication

There are a number of other properties that can be set to change the behavior of the pre-authentication plugin.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>Whether the pre-authentication plugin is active.</td>
<td>false</td>
</tr>
<tr>
<td>failOnError</td>
<td>If true, disallow login if the header is not set or the user does not exist.</td>
<td>false</td>
</tr>
<tr>
<td>userHeader</td>
<td>The HTTP header that will specify the user to authenticate as.</td>
<td>X-Remote-User</td>
</tr>
<tr>
<td>credentialsHeader</td>
<td>A comma-separated list of additional credentials (roles) the user should have.</td>
<td></td>
</tr>
</tbody>
</table>
Chapter 4. Administrative Webinterface

4.1. Surveillance View

When networks are larger and contain devices of different priority, it becomes interesting to show at a glance how the "whole system" is working. The surveillance view aims to do that. By using categories, you can define a matrix which allows to aggregate monitoring results. Imagine you have 10 servers with 10 internet connections and some 5 PCs with DSL lines:

<table>
<thead>
<tr>
<th></th>
<th>Server(s)</th>
<th>Internet Connections</th>
</tr>
</thead>
<tbody>
<tr>
<td>Super important</td>
<td>1 of 10</td>
<td>0 of 10</td>
</tr>
<tr>
<td>Slightly important</td>
<td>0 of 10</td>
<td>0 of 10</td>
</tr>
<tr>
<td>Vanity</td>
<td>4 of 10</td>
<td>0 of 10</td>
</tr>
</tbody>
</table>

The whole idea is to give somebody at a glance a hint on where the trouble is. The matrix-type of display allows a significantly higher aggregation than the simple list. In addition, the surveillance view shows nodes rather than services - an important tidbit of information when you look at categories. At a glance, you want to know how many of my servers have an issue rather than how many services in this category have an issue.

Figure 1. Example of a configured Surveillance View

The visual indication for outages in the surveillance view cells is defined as the following:

- No services down: green as normal
- One (1) service down: yellow as warning
- More than one (1) services down: red as critical

This Surveillance View model also builds the foundation of the Dashboard View.

4.1.1. Default Surveillance View Configuration

Surveillance Views are defined in the surveillance-views.xml file. This file resides in the OpenNMS Horizon etc directory.

This file can be modified in a text editor and is reread every time the Surveillance View page is loaded. Thus, changes to this file do not require OpenNMS Horizon to be restarted.
The default configuration looks like this:

```xml
<surveillance-view-configuration
    xmlns:this="http://www.opennms.org/xsd/config/surveillance-views"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://www.opennms.org/xsd/config/surveillance-views xhttp://www.opennms.org/xsd/config/surveillance-views.xsd"
>
    <default-view name="default">  
        <views>
            <view name="default" refresh-seconds="300">
                <rows>
                    <row-def label="Routers">
                        <category name="Routers"/>
                    </row-def>
                    <row-def label="Switches">
                        <category name="Switches"/>
                    </row-def>
                    <row-def label="Servers">
                        <category name="Servers"/>
                    </row-def>
                </rows>
                <columns>
                    <column-def label="PROD">
                        <category name="Production"/>
                    </column-def>
                    <column-def label="TEST">
                        <category name="Test"/>
                    </column-def>
                    <column-def label="DEV">
                        <category name="Development"/>
                    </column-def>
                </columns>
            </view>
        </views>
    </default-view>
</surveillance-view-configuration>
```

Please note, that the old `report-category` attribute is deprecated and is no longer supported.

### 4.1.2. Configuring Surveillance Views

The *Surveillance View* configuration can also be modified using the *Surveillance View Configurations* editor on the *OpenNMS Horizon Admin* page.
This page gives an overview of the configured Surveillance Views and allows the user to edit, remove or even preview the defined Surveillance View. Furthermore, the default Surveillance View can be selected using the checkbox in the DEFAULT column.

When editing a Surveillance View the user has to define the view’s title and the time in seconds between successive refreshes. On the left side of this dialog the defined rows, on the right side the defined columns are listed. Beside adding new entries an user can modify or delete existing entries. Furthermore, the position of an entry can be modified using the up/down buttons.

Editing row or column definitions require to choose an unique label for this entry and at least one OpenNMS Horizon category. When finished you can hit the Save button to persist your modified configuration or Cancel to close this dialog.

4.1.3. Categorizing Nodes

In order to categorize nodes in the Surveillance View, choose a node and click Edit beside Surveillance Category Memberships. Recalling from your Surveillance View, choose two categories that represent a column and a row, for example, Servers and Test, then click Add.

4.1.4. Creating Views for Users and Groups

You can use user and group names for Surveillance Views. When the Surveillance View page is invoked the following criteria selects the proper Surveillance View to be displayed. The first
matching item wins:

1. Surveillance View name equal to the user name they used when logging into OpenNMS Horizon.
2. Surveillance View name equal to the user’s assigned OpenNMS Horizon group name
3. Surveillance View name equal to the default-view attribute in the surveillance-views.xml configuration file.

4.2. Dashboard

In Network Operation Centers NOC an overview about issues in the network is important and often described as Dashboards. Large networks have people (Operator) with different responsibilities and the Dashboard should show only information for a given monitoring context. Network or Server operator have a need to customize or filter information on the Dashboard. A Dashboard as an At-a-glance overview is also often used to give an entry point for more detailed diagnosis through the information provided by the monitoring system. The Surveillance View allows to reduce the visible information by selecting rows, columns and cells to quickly limit the amount of information to navigate through.

4.2.1. Components

The Dashboard is built with five components:

• Surveillance View: Allows to model a monitoring context for the Dashboard.
• Alarms: Shows unacknowledged Alarms which should be escalated by an Operator.
• Notifications: Shows outstanding and unacknowledged notifications sent to Engineers.
• Node Status: Shows all ongoing network Outages.
• Resource Graph Viewer: Shows performance time series reports for performance diagnosis.

The following screenshot shows a configured Dashboard and which information are displayed in the components.
The following section describes the information shown in each component. All other components display information based on the Surveillance View.

**Surveillance View**

The Surveillance View has multiple functions.

- Allows to model the monitoring context and shows service and node Outages in compact matrix view.
- Allows to limit the number of information in the Dashboard by selecting rows, columns and cells.

You can select columns, rows, single cells and of course all entries in a Surveillance View. Please refer to the Surveillance View Section for details on how to configure Surveillance Views.

**Alarms**

The Alarms component gives an overview about all unacknowledged Alarms with a severity higher than Normal(1).Acknowledged Alarms will be removed from the responsibility of the Operator. The following information are shown in:
Figure 6. Information displayed in the Alarms component

1. **Node**: Node label of the node the Alarm is associated with.
2. **Severity**: Severity of the Alarm.
3. **UEI**: Shows the UEI of the Alarm.
4. **Count**: Number of Alarms deduplicated by the reduction key of the Alarm.
5. **Last Time**: Time for the last occurrence of the Alarm.
6. **Log Msg**: The log message from the Event which is the source for this Alarm. It is specified in the event configuration file in `<logmsg />`.

The Alarms component shows the most recent Alarms and allows the user to scroll through the last 100 Alarms.

**Notifications**

To inform people on a duty schedule notifications are used and force action to fix or reconfigure systems immediately. In OpenNMS Horizon it is possible to acknowledge notifications to see who is working on a specific issue. The Dashboard should show outstanding notifications in the NOC to provide an overview and give the possibility for intervention.

Figure 7. Information displayed in the Notifications component

1. **Node**: Label of the monitored node the notification is associated with.
2. **Service**: Name of the service the notification is associated with.
3. **Message**: Message of the notification.
4. **Sent Time**: Time when the notification was sent.
5. **Responder**: User name who acknowledged the notification.
6. **Response Time**: Time when the user acknowledged the notification.

The Notifications component shows the most recent unacknowledged notifications and allows the user to scroll through the last 100 Notifications.
Node Status

An acknowledged Alarm doesn’t mean necessarily the outage is solved. To give an overview information about ongoing Outages in the network, the Dashboard shows an outage list in the Node Status component.

![Node Status Table]

**Figure 8. Information displayed in the Node Status component**

1. **Node**: Label of the monitored node with ongoing outages.
2. **Current Outages**: Number of services on the node with outages and total number of monitored services, e.g. with the natural meaning of "3 of 3 services are affected".
3. **24 Hour Availability**: Availability of all services provided by the node calculated by the last 24 hours.

Resource Graph Viewer

To give a quick entry point diagnose performance issues a Resource Graph Viewer allows to navigate to time series data reports which are filtered in the context of the Surveillance View.

![Resource Graph Viewer Diagram]

**Figure 9. Show time series based performance with the Resource Graph Viewer**

It allows to navigate sequentially through resource graphs provided by nodes filtered by the Surveillance View context and selection and shows one graph report at a time.

4.2.2. Advanced configuration

The Surveillance View component allows to model multiple views for different monitoring contexts. It gives the possibility to create special view as example for network operators or server operators. The Dashboard shows only one configured Surveillance View. To give different users the possibility using their Surveillance View fitting there requirements it is possible to map a logged in user to a given Surveillance View used in the Dashboard.

The selected nodes from the Surveillance View are also aware of User Restriction Filter. If you have a group of users, which should see just a subset of nodes the Surveillance View will filter nodes which are not related to the assigned user group.
The *Dashboard* is designed to focus, and therefore also restrict, a user’s view to devices of their interest. To do this, a new role was added that can be assigned to a user that restricts them to viewing only the *Dashboard* if that is intended.

**Using the Dashboard role**

The following example illustrates how this *Dashboard* role can be used. For instance the user *drv4doe* is assigned the dashboard role. So, when logging in as *drv4doe*, the user is taking directly to the *Dashboard* page and is presented with a custom *Dashboard* based on the *drv4doe Surveillance View* definition.

**Step 1: Create an user**

The following example assigns a Dashboard to the user "drv4doe" (a router and switch jockey) and restricts the user for navigation to any other link in the OpenNMS Horizon WebUI.

![Image of user creation process](image)

*Figure 10. Creating the user *drv4doe* using the OpenNMS Horizon WebUI*

**Step 2: Change Security Roles**

Now, add the *ROLE_PROVISION* role to the user through the WebUI or by manually editing the `users.xml` file in the `/opt/opennms/etc` directory for the user *drv4doe*. 

---

16
Figure 11. Adding dashboard role to the user `drv4doe` using the OpenNMS Horizon WebUI

```xml
<user>
    <user-id>drv4doe</user-id>
    <full-name>Dashboard User</full-name>
    <password salt="true">6FOip6hgZsUwDhdzdPUVV5UhkSxdbZTlq8M5LXWG5586eDPa7BFizirjXEfV/srK</password>
    <role>ROLE_DASHBOARD</role>
</user>
```

Step 3: Define Surveillance View

Edit the `$OPENNMS_HOME/etc/surveilliance-view.xml` file to add a definition for the user `drv4doe`, which you created in step 1.
<surveillance-view-configuration
xmlns:this="http://www.opennms.org/xsd/config/surveillance-views"
xmns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://www.opennms.org/xsd/config/surveillance-views http://www.opennms.org/xsd/config/surveillance-views.xsd"
default-view="default">
<views>
  <view name="drv4doe" refresh-seconds="300">
    <rows>
      <row-def label="Servers">
        <category name="Servers"/>
      </row-def>
    </rows>
    <columns>
      <column-def label="PROD">
        <category name="Production"/>
      </column-def>
      <column-def label="TEST">
        <category name="Test"/>
      </column-def>
    </columns>
  </view>
  <!-- default view here -->
  <view name="default" refresh-seconds="300">
    <rows>
      <row-def label="Routers">
        <category name="Routers"/>
      </row-def>
      <row-def label="Switches">
        <category name="Switches"/>
      </row-def>
      <row-def label="Servers">
        <category name="Servers"/>
      </row-def>
    </rows>
    <columns>
      <column-def label="PROD">
        <category name="Production"/>
      </column-def>
      <column-def label="TEST">
        <category name="Test"/>
      </column-def>
      <column-def label="DEV">
        <category name="Development"/>
      </column-def>
    </columns>
  </view>
</views>
</surveillance-view-configuration>
This configuration and proper assignment of node categories will produce a default Dashboard for all users, other than drv4doe.

You can hide the upper navigation on any page by specifying ?quiet=true; adding it to the end of the OpenNMS Horizon URL. This is very handy when using the dashboard on a large monitor or tv screen for office wide viewing.

However, when logging in as drv4doe, the user is taking directly to the Dashboard page and is presented with a Dashboard based on the custom Surveillance View definition.

The drv4doe user is not allowed to navigate to URLs other than the dashboard.jsp URL. Doing so will result in an Access Denied error.

Anonymous dashboards

You can modify the configuration files for the security framework to give you access to one or more dashboards without logging in. At the end you'll be able to point a browser at a special URL like `<code><a href="http://&amp;8230;/opennms/dashboard1" class="bare">http://&amp;8230;/opennms/dashboard1</a></code>` or `<code><a href="http://&amp;8230;/opennms/dashboard2" class="bare">http://&amp;8230;/opennms/dashboard2</a></code>` and see a dashboard without any authentication. First, configure surveillance views and create dashboard users as above. For example, make two dashboards and two users called `dashboard1` and `dashboard2`. Test that you can log in as each of the new users and see the correct dashboard. Now create some aliases you can use to distinguish between dashboards. In `<code>/opt/opennms/jetty-webapps/opennms/WEB-INF</code>`, edit `<code>web.xml</code>`. Just before the first `<code>&lt;servlet-mapping&gt;</code>` tag, add the following servlet entries:

```
<servlet>
  <servlet-name>dashboard1</servlet-name>
  <jsp-file>/dashboard.jsp</jsp-file>
</servlet>

<servlet>
  <servlet-name>dashboard2</servlet-name>
  <jsp-file>/dashboard.jsp</jsp-file>
</servlet>
```

Just before the first `<code>&lt;error-page&gt;</code>` tag, add the following servlet-mapping entries:
After the last `<filter-mapping>` tag, add the following filter-mapping entries:

```xml
<filter-mapping>
  <filter-name>AddRefreshHeader-120</filter-name>
  <url-pattern>/dashboard.jsp</url-pattern>
</filter-mapping>
<filter-mapping>
  <filter-name>AddRefreshHeader-120</filter-name>
  <url-pattern>/dashboard1</url-pattern>
</filter-mapping>
<filter-mapping>
  <filter-name>AddRefreshHeader-120</filter-name>
  <url-pattern>/dashboard2</url-pattern>
</filter-mapping>
```

Next edit `applicationContext-acegi-security.xml` to enable anonymous authentication for the `/dashboard1` and `/dashboard2` aliases. Near the top of the file, find `<bean id="filterChainProxy" ...>`. Below the entry for `/rss.jsp*`, add an entry for each of the dashboard aliases:
<bean id="filterChainProxy" class="org.acegisecurity.util.FilterChainProxy">
  <property name="filterInvocationDefinitionSource">
    <value>
      CONVERT_URL_TO_LOWERCASE_BEFORE_COMPARISON
      PATTERN_TYPE_APACHE_ANT
    </value>
  </property>
</bean>

/rss.jsp*=httpSessionContextIntegrationFilter,logoutFilter,authenticationProcessingFilter,basicProcessingFilter,securityContextHolderAwareRequestFilter,anonymousProcessingFilter,basicExceptionTranslationFilter,filterInvocationInterceptor
/dashboard1*=httpSessionContextIntegrationFilter,logoutFilter,securityContextHolderAwareRequestFilter,dash1AnonymousProcessingFilter,filterInvocationInterceptor
/dashboard2*=httpSessionContextIntegrationFilter,logoutFilter,securityContextHolderAwareRequestFilter,dash2AnonymousProcessingFilter,filterInvocationInterceptor
/**=httpSessionContextIntegrationFilter,logoutFilter,authenticationProcessingFilter,basicProcessingFilter,securityContextHolderAwareRequestFilter,anonymousProcessingFilter,exceptionTranslationFilter,filterInvocationInterceptor
...

About halfway through the file, look for <bean id="filterInvocationInterceptor" ...>. Below the entry for /dashboard.jsp, add an entry for each of the aliases:

<bean id="filterInvocationInterceptor" class="org.acegisecurity.intercept.web.FilterSecurityInterceptor">
...
/frontpage.htm=ROLE_USER,ROLE_DASHBOARD
/dashboard.jsp=ROLE_USER,ROLE_DASHBOARD
/dashboard1=ROLE_USER,ROLE_DASHBOARD
/dashboard2=ROLE_USER,ROLE_DASHBOARD
/gwt.js=ROLE_USER,ROLE_DASHBOARD
...

Finally, near the bottom of the page, add a new instance of AnonymousProcessingFilter for each alias.
Restart OpenNMS Horizon and you should bring up a dashboard at `<code><a href="http://…/opennms/dashboard1" class="bare">http://…/opennms/dashboard1</a></code>` without logging in.

There's no way to switch dashboards without closing the browser (or deleting the JSESSIONID session cookie).

If you accidentally click a link that requires full user privileges (e.g. Node List), you'll be given a login form. Once you get to the login form, there's no going back to the dashboard without restarting the browser. If this problem bothers you, you can set `ROLE_USER` in addition to `ROLE_DASHBOARD` in your `userAttribute` property. However this will give full user access to anonymous browsers.

### 4.3. Grafana Dashboard Box

Grafana provides an API key which gives access for 3rd party application like OpenNMS Horizon. The Grafana Dashboard Box on the start page shows dashboards related to OpenNMS Horizon. To filter relevant dashboards, you can use a tag for dashboards and make them accessible. If no tag is provided all dashboards from Grafana will be shown.

The feature is by default deactivated and is configured through `opennms.properties`. Please note that this feature works with the Grafana API v2.5.0.

*Quick access to Grafana dashboards from the OpenNMS Horizon start page*
Table 2. Grafana Dashboard configuration properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>org.opennms.grafanaBox.show</td>
<td>Boolean</td>
<td>This setting controls whether a grafana box showing the available dashboards is placed on the landing page. The two valid options for this are true or false.</td>
<td>false</td>
</tr>
<tr>
<td>org.opennms.grafanaBox.hostname</td>
<td>String</td>
<td>If the box is enabled you also need to specify hostname of the Grafana server</td>
<td>localhost</td>
</tr>
<tr>
<td>org.opennms.grafanaBox.port</td>
<td>Integer</td>
<td>The port of the Grafana server ReST API</td>
<td>3000</td>
</tr>
<tr>
<td>org.opennms.grafanaBox.basePath</td>
<td>String</td>
<td>The Grafana base path to be used</td>
<td></td>
</tr>
<tr>
<td>org.opennms.grafanaBox.apiKey</td>
<td>String</td>
<td>The API key is needed for the ReST calls to work</td>
<td></td>
</tr>
<tr>
<td>org.opennms.grafanaBox.tag</td>
<td>String</td>
<td>When a tag is specified only dashboards with this given tag will be displayed. When no tag is given all dashboards will be displayed</td>
<td></td>
</tr>
<tr>
<td>org.opennms.grafanaBox.protocol</td>
<td>String</td>
<td>The protocol for the ReST call can also be specified</td>
<td>http</td>
</tr>
<tr>
<td>org.opennms.grafanaBox.connectionTimeout</td>
<td>Integer</td>
<td>Timeout in milliseconds for getting information from the Grafana server</td>
<td>500</td>
</tr>
<tr>
<td>org.opennms.grafanaBox.socketTimeout</td>
<td>Integer</td>
<td>Socket timeout</td>
<td>500</td>
</tr>
<tr>
<td>org.opennms.grafanaBox.dashboardLimit</td>
<td>Integer</td>
<td>Maximum number of entries to be displayed (0 for unlimited)</td>
<td>0</td>
</tr>
</tbody>
</table>
If you have Grafana behind a proxy it is important the org.opennms.grafanaBox.hostname is reachable. This host name is used to generate links to the Grafana dashboards.

The process to generate an Grafana API Key can be found in the HTTP API documentation. Copy the API Key to opennms.properties as org.opennms.grafanaBox.apiKey.

4.4. Operator Board

In a network operation center (NOC) the Ops Board can be used to visualize monitoring information. The monitoring information for various use-cases are arranged in configurable Dashlets. To address different user groups it is possible to create multiple Ops Boards.

There are two visualisation components to display Dashlets:

- Ops Panel: Shows multiple Dashlets on one screen, e.g. on a NOC operators workstation
- Ops Board: Shows one Dashlet at a time in rotation, e.g. for a screen wall in a NOC

![Ops Panel with Dashlets](image)

*Figure 12. Concept of Dashlets displayed in Ops Panel*
Figure 13. Concept to show Dashlets in rotation on the Ops Board

4.4.1. Configuration

To create and configure Ops Boards administration permissions are required. The configuration section is in admin area of OpenNMS Horizon and named Ops Board Config Web Ui.
Create or modify **Ops Boards** is described in the following screenshot.

1. Create a new **Ops Board** to organize and arrange different **Dashlets**
2. The name to identify the **Ops Board**
3. Add a **Dashlet** to show OpenNMS Horizon monitoring information
4. Show a preview of the whole *Ops Board*

5. List of available *Dashlets*

6. *Priority* for this *Dashlet* in *Ops Board* rotation, lower priority means it will be displayed more often

7. *Duration* in seconds for this *Dashlet* in the *Ops Board* rotation

8. Change *Priority* if the *Dashlet* is in alert state, this is optional and maybe not available in all *Dashlets*

9. Change *Duration* if the *Dashlet* is in alert state, it is optional and maybe not available in all *Dashlets*

10. Configuration properties for this *Dashlet*

11. Remove this *Dashlet* from the *Ops Board*

12. Order *Dashlets* for the rotation on the *Ops Board* and the tile view in the *Ops Panel*

13. Show a preview for the whole *Ops Board*

The configured *Ops Board* can be used by navigating in the main menu to *Dashboard* → *Ops Board*.

![Image](image.png)

*Figure 16. Navigation to use the Ops Board*

### 4.4.2. Dashlets

Visualization of information is implemented in *Dashlets*. The different *Dashlets* are described in this section with all available configuration parameter.

To allow filter information the *Dashlet* can be configured with a generic *Criteria Builder*.

#### Alarm Details

This *Alarm-Details Dashlet* shows a table with alarms and some detailed information.
Table 3. Information of the alarms

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alarm ID</td>
<td>OpenNMS Horizon ID for the alarm</td>
</tr>
<tr>
<td>Severity</td>
<td>Alarm severity (Cleared, Indeterminate, Normal, Warning, Minor, Major, Critical)</td>
</tr>
<tr>
<td>Node label</td>
<td>Node label of the node where the alarm occurred</td>
</tr>
<tr>
<td>Alarm count</td>
<td>Alarm count based on reduction key for deduplication</td>
</tr>
<tr>
<td>Last Event Time</td>
<td>Last time the alarm occurred</td>
</tr>
<tr>
<td>Log Message</td>
<td>Reason and detailed log message of the alarm</td>
</tr>
</tbody>
</table>

The Alarm Details Dashlet can be configured with the following parameters.

- Boost support: Boosted Severity
- Configuration: Criteria Builder

Alarms

This Alarms Dashlet shows a table with a short alarm description.

Table 4. Information of the alarm

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time</td>
<td>Absolute time since the alarm appeared</td>
</tr>
<tr>
<td>Node label</td>
<td>Node label of the node where the alarm occurred</td>
</tr>
<tr>
<td>UEI</td>
<td>OpenNMS Horizon Unique Event Identifier for this alarm</td>
</tr>
</tbody>
</table>

The Alarms Dashlet can be configured with the following parameters.

- Boost support: Boosted Severity
- Configuration: Criteria Builder

Charts

This Dashlet displays an existing Chart.

- Boost support: false
- Chart: Name of the existing chart to display
- Maximize Width: Rescale the image to fill display width
- Maximize Height: Rescale the image to fill display height
Grafana

This Dashlet shows a Grafana Dashboard for a given time range. The Grafana Dashboard Box configuration defined in the opennms.properties file is used to access the Grafana instance.

<table>
<thead>
<tr>
<th>Boost support</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>title</td>
<td>Title of the Grafana dashboard to be displayed</td>
</tr>
<tr>
<td>uri</td>
<td>URI to the Grafana Dashboard to be displayed</td>
</tr>
<tr>
<td>from</td>
<td>Start of time range</td>
</tr>
<tr>
<td>to</td>
<td>End of time range</td>
</tr>
</tbody>
</table>

Image

This Dashlet displays an image by a given URL.

<table>
<thead>
<tr>
<th>Boost support</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>imageUrl</td>
<td>URL with the location of the image to show in this Dashlet</td>
</tr>
<tr>
<td>maximizeHeight</td>
<td>Rescale the image to fill display width</td>
</tr>
<tr>
<td>maximizeWidth</td>
<td>Rescale the image to fill display height</td>
</tr>
</tbody>
</table>

KSC

This Dashlet shows an existing KSC report. The view is exact the same as the KSC report is build regarding order, columns and time spans.

<table>
<thead>
<tr>
<th>Boost support</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>KSC-Report</td>
<td>Name of the KSC report to show in this Dashlet</td>
</tr>
</tbody>
</table>

Map

This Dashlet displays the geographical map.

<table>
<thead>
<tr>
<th>Boost support</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>search</td>
<td>Predefined search for a subset of nodes shown in the geographical map in this Dashlet</td>
</tr>
</tbody>
</table>

RRD

This Dashlet shows one or multiple RRD graphs. It is possible to arrange and order the RRD graphs in multiple columns and rows. All RRD graphs are normalized with a given width and height.

<p>| Boost support | false |</p>
<table>
<thead>
<tr>
<th>Columns</th>
<th>Number of columns within the <em>Dashlet</em></th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows</td>
<td>Number of rows with the <em>Dashlet</em></td>
</tr>
<tr>
<td>KSC Report</td>
<td>Import RRD graphs from an existing KSC report and re-arrange them.</td>
</tr>
<tr>
<td>Graph Width</td>
<td>Generic width for all RRD graphs in this <em>Dashlet</em></td>
</tr>
<tr>
<td>Graph Height</td>
<td>Generic height for all RRD graphs in this <em>Dashlet</em></td>
</tr>
<tr>
<td>Timeframe value</td>
<td>Number of the given <em>Timeframe type</em></td>

**Topology**

This *Dashlet* shows a *Topology Map*. The *Topology Map* can be configured with the following parameter.

<table>
<thead>
<tr>
<th>Boost support</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>focusNodes</td>
<td>Which node(s) is in focus for the topology</td>
</tr>
<tr>
<td>provider</td>
<td>Which topology should be displayed, e.g. Linkd, VMware</td>
</tr>
<tr>
<td>szl</td>
<td>Set the zoom level for the topology</td>
</tr>
</tbody>
</table>
URL

This Dashlet shows the content of a web page or other web application, e.g. other monitoring systems by a given URL.

<table>
<thead>
<tr>
<th>Boost support</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>password</td>
<td>Optional password if a basic authentication is required</td>
</tr>
<tr>
<td>url</td>
<td>URL to the web application or web page</td>
</tr>
<tr>
<td>username</td>
<td>Optional username if a basic authentication is required</td>
</tr>
</tbody>
</table>

4.4.3. Boosting Dashlet

The behavior to boost a Dashlet describes the behavior of a Dashlet showing critical monitoring information. It can raise the priority in the Ops Board rotation to indicate a problem. This behavior can be configured with the configuration parameter Boost Priority and Boost Duration. These two configuration parameters affect the behavior on the Ops Board in rotation.

- Boost Priority: Absolute priority of the Dashlet with critical monitoring information.
- Boost Duration: Absolute duration in seconds of the Dashlet with critical monitoring information.

4.4.4. Criteria Builder

The Criteria Builder is a generic component to filter information of a Dashlet. Some Dashlets use this component to filter the shown information on a Dashlet for certain use case. It is possible to combine multiple Criteria to display just a subset of information in a given Dashlet.

Table 5. Generic Criteria Builder configuration possibilities

</tr>
</tbody>
</table>

For date values, absolute value can be specified in ISO format, e.g. `2019-06-20T20:45:15.123-05:00`. Relative times can be specified by `+seconds` and `-seconds`.
4.5. JMX Configuration Generator

*OpenNMS Horizon* implements the JMX protocol to collect long term performance data for Java applications. There are a huge variety of metrics available and administrators have to select which information should be collected. The *JMX Configuration Generator Tools* is build to help generating valid complex JMX data collection configuration and *RRD graph* definitions for *OpenNMS Horizon*.

This tool is available as CLI and a web based version.

4.5.1. Web based utility

Complex JMX data collection configurations can be generated from a web based tool. It collects all available *MBean Attributes* or *Composite Data Attributes* from a JMX enabled Java application.

The workflow of the tool is:

1. Connect with JMX or JMXMP against a *MBean Server* provided of a Java application
2. Retrieve all *MBean* and *Composite Data* from the application
3. Select specific *MBeans* and *Composite Data* objects which should be collected by *OpenNMS Horizon*
4. Generate *JMX Collectd* configuration file and *RRD graph* definitions for *OpenNMS Horizon* as downloadable archive

The following connection settings are supported:

- Ability to connect to *MBean Server* with RMI based JMX
- Authentication credentials for JMX connection
- Optional: JMXMP connection

The web based configuration tool can be used in the *OpenNMS Horizon Web Application* in administration section *Admin → JMX Configuration Generator*.

**Configure JMX Connection**

At the beginning the connection to an *MBean Server* of a Java application has to be configured.
Figure 17. JMX connection configuration window

- **Service name**: The name of the service to bind the JMX data collection for Collectd
- **Host**: IP address or FQDN connecting to the MBean Server to load MBeans and Composite Data into the generation tool
- **Port**: Port to connect to the MBean Server
- **Authentication**: Enable / Disable authentication for JMX connection with username and password
- **Skip non-number values**: Skip attributes with non-number values
- **JMXMP**: Enable / Disable JMX Messaging Protocol instead of using JMX over RMI

By clicking the arrow ( > ) the MBeans and Composite Data will be retrieved with the given connection settings. The data is loaded into the MBeans Configuration screen which allows to select metrics for the data collection configuration.

**Select MBeans and Composite**

The MBeans Configuration section is used to assign the MBean and Composite Data attributes to RRD domain specific data types and data source names.
Figure 18. Select MBeans or Composite Data for OpenNMS Horizon data collection

The left sidebar shows the tree with the JMX Domain, MBeans and Composite Data hierarchy retrieved from the MBean Server. To select or deselect all attributes use Mouse right click → select/deselect.

The right panel shows the MBean Attributes with the RRD specific mapping and allows to select or deselect specific MBean Attributes or Composite Data Attributes for the data collection configuration.

Figure 19. Configure MBean attributes for data collection configuration

Figure 20. Configure Composite attributes for data collection configuration
• **MBean Name or Composite Alias**: Identifies the MBean or the Composite Data object
• **Selected**: Enable/Disable the **MBean attribute or Composite Member** to be included in the data collection configuration
• **Name**: Name of the **MBean attribute or Composite Member**
• **Alias**: the **data source name** for persisting measurements in RRD or JRobin file
• **Type**: Gauge or Counter data type for persisting measurements in RRD or JRobin file

The **MBean Name**, **Composite Alias** and **Name** are validated against special characters. For the **Alias** inputs are validated to be not longer then 19 characters and have to be unique in the data collection configuration.

**Download and include configuration**

The last step is generating the following configuration files for **OpenNMS Horizon**:

• **collectd-configuration.xml**: Generated sample configuration assigned to a service with a matching data collection group
• **jmx-datacollection-config.xml**: Generated JMX data collection configuration with the selected MBeans and Composite Data
• **snmp-graph.properties**: Generated default RRD graph definition files for all selected metrics

The content of the configuration files can be copy & pasted or can be downloaded as **ZIP archive**.

If the content of the configuration file exceeds 2,500 lines, the files can only be downloaded as **ZIP archive**.

**4.5.2. CLI based utility**

The command line (CLI) based tool is not installed by default. It is available as Debian and RPM package in the official repositories.

**Installation**

**RHEL based installation with Yum**

```
yum install opennms-jmx-config-generator
```

**Debian based installation with apt**

```
apt-get install opennms-jmx-config-generator
```

**Installation from source**

It is required to have the **Java 8 Development Kit** with **Apache Maven** installed. The `mvn` binary has to be in the path environment. After cloning the repository you have to enter the source folder and compile an executable **JAR**.
cd opennms/features/jmx-config-generator
mvn package

Inside the newly created target folder a file named jmxconfiggenerator-<VERSION>-onejar.jar is present. This file can be invoked by:

```text
cd opennms/features/jmx-config-generator
mvn package
```

```text
java -jar target/jmxconfiggenerator-26.1.3-SNAPSHOT-onejar.jar
```

**Usage**

After installing the JMX Config Generator the tool's wrapper script is located in the `${OPENNMS_HOME}/bin` directory.

```text
$ cd /path/to/opennms/bin
$ ./jmx-config-generator
```

When invoked without parameters the usage and help information is printed.

The JMX Config Generator uses sub-commands for the different configuration generation tasks. Each of these sub-commands provide different options and parameters. The command line tool accepts the following sub-commands.

<table>
<thead>
<tr>
<th>Sub-command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query</td>
<td>Queries a MBean Server for certain MBeans and attributes.</td>
</tr>
<tr>
<td>generate-conf</td>
<td>Generates a valid jmx-datacollection-config.xml file.</td>
</tr>
<tr>
<td>generate-graph</td>
<td>Generates a RRD graph definition file with matching graph definitions for a given jmx-datacollection-config.xml.</td>
</tr>
</tbody>
</table>

The following global options are available in each of the sub-commands of the tool:

<table>
<thead>
<tr>
<th>Option/Argument</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h (--help)</td>
<td>Show help and usage information.</td>
<td>false</td>
</tr>
<tr>
<td>-v (--verbose)</td>
<td>Enables verbose mode for debugging purposes.</td>
<td>false</td>
</tr>
</tbody>
</table>

**Sub-command: query**

This sub-command is used to query a MBean Server for it's available MBean objects. The following example queries the server myserver with the credentials myusername/mypassword on port 7199 for MBean objects in the java.lang domain.

```text
java -jar target/jmxconfiggenerator-26.1.3-SNAPSHOT-onejar.jar
```
The following command line options are available for the `query` sub-command.

<table>
<thead>
<tr>
<th>Option/Argument</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;filter criteria&gt;</code></td>
<td>A filter criteria to query the MBean Server for. The format is <code>&lt;objectname&gt;[:&lt;attribute name&gt;]</code>. The <code>&lt;objectname&gt;</code> accepts the default JMX object name pattern to identify the MBeans to be retrieved. If <code>null</code> all domains are shown. If no key properties are specified, the domain’s MBeans are retrieved. To execute for certain attributes, you have to add <code>:&lt;attribute name&gt;</code>. The <code>&lt;attribute name&gt;</code> accepts regular expressions. When multiple <code>&lt;filter criteria&gt;</code> are provided they are OR concatenated.</td>
<td>-</td>
</tr>
<tr>
<td><code>--host &lt;host&gt;</code></td>
<td>Hostname or IP address of the remote JMX host.</td>
<td>-</td>
</tr>
<tr>
<td><code>--ids-only</code></td>
<td>Only show the ids of the attributes.</td>
<td>false</td>
</tr>
<tr>
<td><code>--ignore &lt;filter criteria&gt;</code></td>
<td>Set <code>&lt;filter criteria&gt;</code> to ignore while running.</td>
<td>-</td>
</tr>
<tr>
<td><code>--include-values</code></td>
<td>Include attribute values.</td>
<td>false</td>
</tr>
<tr>
<td><code>--jmxmp</code></td>
<td>Use JMXMP and not JMX over RMI.</td>
<td>false</td>
</tr>
<tr>
<td><code>--password &lt;password&gt;</code></td>
<td>Password for JMX authentication.</td>
<td>-</td>
</tr>
<tr>
<td><code>--port &lt;port&gt;</code></td>
<td>Port of JMX service.</td>
<td>-</td>
</tr>
<tr>
<td>Option/Argument</td>
<td>Description</td>
<td>Default</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
</tr>
<tr>
<td>--show-domains</td>
<td>Only lists the available domains.</td>
<td>true</td>
</tr>
<tr>
<td>--show-empty</td>
<td>Includes MBeans, even if they do not have attributes. Either due to the &lt;filter criteria&gt; or while there are none.</td>
<td>false</td>
</tr>
<tr>
<td>--url &lt;url&gt;</td>
<td>Custom connection URL &lt;hostname&gt;:&lt;port&gt; service:jmx:&lt;protocol&gt;:&lt;sap&gt;</td>
<td>-</td>
</tr>
<tr>
<td>--username &lt;username&gt;</td>
<td>Username for JMX authentication.</td>
<td>-</td>
</tr>
<tr>
<td>-h (--help)</td>
<td>Show help and usage information.</td>
<td>false</td>
</tr>
<tr>
<td>-v (--verbose)</td>
<td>Enables verbose mode for debugging purposes.</td>
<td>false</td>
</tr>
</tbody>
</table>

**Sub-command: generate-conf**

This sub-command can be used to generate a valid `jmx-datacollection-config.xml` for a given set of MBean objects queried from a MBean Server.

The following example generate a configuration file `myconfig.xml` for MBean objects in the `java.lang` domain of the server `myserver` on port 7199 with the credentials `myusername/mypassword`. You have to define either an `URL` or a hostname and port to connect to a JMX server.

```
jmx-config-generator generate-conf --host myserver --username myusername --password mypassword --port 7199 "java.lang:*" --output myconfig.xml
Dictionary entries loaded: '18'
```

The following options are available for the `generate-conf` sub-command.

<table>
<thead>
<tr>
<th>Option/Argument</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;attribute id&gt;</td>
<td>A list of attribute Ids to be included for the generation of the configuration file.</td>
<td>-</td>
</tr>
<tr>
<td>--dictionary &lt;file&gt;</td>
<td>Path to a dictionary file for replacing attribute names and part of MBean attributes. The file should have for each line a replacement, e.g. Auxillary:Auxil.</td>
<td>-</td>
</tr>
<tr>
<td>--host &lt;host&gt;</td>
<td>Hostname or IP address of JMX host.</td>
<td>-</td>
</tr>
<tr>
<td>--jmxmp</td>
<td>Use JMXMP and not JMX over RMI.</td>
<td>false</td>
</tr>
<tr>
<td>--output &lt;file&gt;</td>
<td>Output filename to write generated <code>jmx-datacollection-config.xml</code>.</td>
<td>-</td>
</tr>
<tr>
<td>Option/Argument</td>
<td>Description</td>
<td>Default</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------</td>
<td>---------</td>
</tr>
<tr>
<td>--password &lt;password&gt;</td>
<td>Password for JMX authentication.</td>
<td>-</td>
</tr>
<tr>
<td>--port &lt;port&gt;</td>
<td>Port of JMX service</td>
<td>-</td>
</tr>
<tr>
<td>--print-dictionary</td>
<td>Prints the used dictionary to STDOUT. May be used with --dictionary</td>
<td>false</td>
</tr>
<tr>
<td>--service &lt;value&gt;</td>
<td>The Service Name used as JMX data collection name.</td>
<td>anyservice</td>
</tr>
<tr>
<td>--skipDefaultVM</td>
<td>Skip default JavaVM Beans.</td>
<td>false</td>
</tr>
<tr>
<td>--skipNonNumber</td>
<td>Skip attributes with non-number values</td>
<td>false</td>
</tr>
<tr>
<td>--username &lt;username&gt;</td>
<td>Username for JMX authentication</td>
<td>-</td>
</tr>
<tr>
<td>-h (--help)</td>
<td>Show help and usage information.</td>
<td>false</td>
</tr>
<tr>
<td>-v (--verbose)</td>
<td>Enables verbose mode for debugging purposes.</td>
<td>false</td>
</tr>
</tbody>
</table>

The option --skipDefaultVM offers the ability to ignore the MBeans provided as standard by the JVM and just create configurations for the MBeans provided by the Java Application itself. This is particularly useful if an optimized configuration for the JVM already exists. If the --skipDefaultVM option is not set the generated configuration will include the MBeans of the JVM and the MBeans of the Java Application.

Check the file and see if there are alias names with more than 19 characters. This errors are marked with NAME_CRASH_AS_19_CHAR_VALUE

Sub-command: generate-graph

This sub-command generates a RRD graph definition file for a given configuration file. The following example generates a graph definition file mygraph.properties using the configuration in file myconfig.xml.
The following options are available for this sub-command.

<table>
<thead>
<tr>
<th>Option/Argument</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>--input &lt;jmx-datacollection.xml&gt;</td>
<td>Configuration file to use as input to generate the graph properties file.</td>
<td></td>
</tr>
<tr>
<td>--output &lt;file&gt;</td>
<td>Output filename for the generated graph properties file.</td>
<td></td>
</tr>
<tr>
<td>--print-template</td>
<td>Prints the default template.</td>
<td>false</td>
</tr>
<tr>
<td>--template &lt;file&gt;</td>
<td>Template file using <em>Apache Velocity</em> template engine to be used to generate the graph properties.</td>
<td></td>
</tr>
<tr>
<td>-h (--help)</td>
<td>Show help and usage information.</td>
<td>false</td>
</tr>
<tr>
<td>-v (--verbose)</td>
<td>Enables verbose mode for debugging purposes.</td>
<td>false</td>
</tr>
</tbody>
</table>

**Graph Templates**

The *JMX Config Generator* uses a template file to generate the graphs. It is possible to use a user-defined template. The option `--template` followed by a file lets the *JMX Config Generator* use the external template file as base for the graph generation. The following example illustrates how a custom template `mytemplate.vm` is used to generate the graph definition file `mygraph.properties` using the configuration in file `myconfig.xml`.

```bash
./jmx-config-generator generate-graph --input myconfig.xml --output mygraph.properties --template mytemplate.vm
```

The template file has to be an *Apache Velocity* template. The following sample represents the template that is used by default:
The **JMX Config Generator** generates different types of graphs from the `jmx-datacollection-config.xml`. The different types are listed below:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AttributeReport</td>
<td>For each attribute of any <em>MBean</em> a graph will be generated. Composite attributes will be ignored.</td>
</tr>
<tr>
<td>MbeanReport</td>
<td>For each <em>MBean</em> a combined graph with all attributes of the <em>MBeans</em> is generated. Composite attributes will be ignored.</td>
</tr>
<tr>
<td>CompositeReport</td>
<td>For each composite attribute of every <em>MBean</em> a graph is generated.</td>
</tr>
<tr>
<td>CompositeAttribute Report</td>
<td>For each composite member of every <em>MBean</em> a combined graph with all composite attributes is generated.</td>
</tr>
</tbody>
</table>

### 4.6. Heatmap

The **Heatmap** can be either be used to display unacknowledged alarms or to display ongoing outages of nodes. Each of this visualizations can be applied on categories, foreign sources or services of nodes. The sizing of an entity is calculated by counting the services inside the entity. Thus, a node with fewer services will appear in a smaller box than a node with more services.
The feature is by default deactivated and is configured through `opennms.properties`.

**Heatmap visualizations of alarms**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>org.opennms.heatmap.defaultMode</code></td>
<td>String</td>
<td>There exist two options for using the heatmap: alarms and outages. This option configures which are displayed per default.</td>
<td>alarms</td>
</tr>
<tr>
<td><code>org.opennms.heatmap.defaultHeatmap</code></td>
<td>String</td>
<td>This option defines which Heatmap is displayed by default. Valid options are categories, foreignSources and monitoredServices.</td>
<td>categories</td>
</tr>
<tr>
<td><code>org.opennms.heatmap.categoryFilter</code></td>
<td>String</td>
<td>The following option is used to filter for categories to be displayed in the Heatmap. This option uses the Java regular expression syntax. The default is .* so all categories will be displayed.</td>
<td>.*</td>
</tr>
<tr>
<td><code>org.opennms.heatmap.foreignSourceFilter</code></td>
<td>String</td>
<td>The following option is used to filter for foreign sources to be displayed in the Heatmap. This option uses the Java regular expression syntax. The default is .* so all foreign sources will be displayed.</td>
<td>.*</td>
</tr>
<tr>
<td><code>org.opennms.heatmap.serviceFilter</code></td>
<td>String</td>
<td>The following option is used to filter for services to be displayed in the Heatmap. This option uses the Java regular expression syntax. The default is .* so all services will be displayed.</td>
<td>.*</td>
</tr>
<tr>
<td><code>org.opennms.heatmap.onlyUnacknowledged</code></td>
<td>Boolean</td>
<td>This option configures whether only unacknowledged alarms will be taken into account when generating the alarm-based version of the Heatmap.</td>
<td>false</td>
</tr>
<tr>
<td><code>org.opennms.web.console.centerUrl</code></td>
<td>String</td>
<td>You can also place the Heatmap on the landing page by setting this option to /heatmap/heatmap-box.jsp.</td>
<td>/surveillance-box.jsp</td>
</tr>
</tbody>
</table>
You can use negative lookahead expressions for excluding categories you wish not to be displayed in the heatmap, e.g. by using an expression like `^(?!XY).*` you can filter out entities with names starting with `XY`.

4.7. Trend

The *Trend* feature allows to display small inline charts of database-based statistics. These chart are accessible in the *Status* menu of the *OpenNMS* web application. Furthermore it is also possible to configure these charts to be displayed on the *OpenNMS* landing page. To achieve this alter the `org.opennms.web.console.centerUrl` property to also include the entry `/trend/trend-box.htm`.

*Trend chart structure*

These charts can be configured and defined in the *trend-configuration.xml* file in your *OpenNMS* *etc* directory. The following sample defines a *Trend* chart for displaying nodes with ongoing outages.
Sample Trend chart XML definition for displaying nodes with outages

```xml
<trend-definition name="nodes">
  <title>Nodes</title>  ①
  <subtitle>w/ Outages</subtitle>  ②
  <visible>true</visible>  ③
  <icon>fa-fire</icon>  ④
  <trend-attributes>  ⑤
    <trend-attribute key="sparkWidth" value="100%"/>
    <trend-attribute key="sparkHeight" value="35"/>
    <trend-attribute key="sparkChartRangeMin" value="0"/>
    <trend-attribute key="sparkLineColor" value="white"/>
    <trend-attribute key="sparkLineWidth" value="1.5"/>
    <trend-attribute key="sparkFillColor" value="#88BB55"/>
    <trend-attribute key="sparkSpotColor" value="white"/>
    <trend-attribute key="sparkMinSpotColor" value="white"/>
    <trend-attribute key="sparkMaxSpotColor" value="white"/>
    <trend-attribute key="sparkSpotRadius" value="3"/>
    <trend-attribute key="sparkHighlightSpotColor" value="white"/>
    <trend-attribute key="sparkHighlightLineColor" value="white"/>
  </trend-attributes>
  <descriptionLink>outage/list.htm?outtype=current</descriptionLink>  ⑥
  <description>${intValue[23]} NODES WITH OUTAGE(S)</description>  ⑦
  <query>  ⑧
    <![CDATA[
      select (select count(distinct nodeid)
        from outages o, events e
        where e.eventid = o.svclosteventid
          and iflostservice < E
          and (ifregainedservice is null
              or ifregainedservice > E)
      ) from (select now() - interval '1 hour' * (O + 1) AS S,
        now() - interval '1 hour' * O as E
        from generate_series(0, 23) as O
      ) I order by S;
    ]]>  
  </query>
</trend-definition>
```

① title of the Trend chart, see below for supported variable substitutions
② subtitle of the Trend chart, see below for supported variable substitutions
③ defines whether the chart is visible by default
It is possible to use values or aggregated values in the title, subtitle and description fields. The following table describes the available variable substitutions.

**Table 7. Variables usable in definition’s title, subtitle and description fields**

<table>

You can also display a single graph in your JSP files by including the file `/trend/single-trend-box.jsp` and specifying the `name` parameter.
Sample JSP snippet to include a single Trend chart with name 'example'

```jsp
<jsp:include page="/trend/single-trend-box.jsp" flush="false">
    <jsp:param name="name" value="example"/>
</jsp:include>
```
Chapter 5. Service Assurance

This section will cover the basic functionalities how OpenNMS Horizon tests if a service or device available and measure his latency.

In OpenNMS Horizon this task is provided by a Service Monitor framework. The main component is Pollerd which provides the following functionality:

- Track the status of a management resource or an application for availability calculations
- Measure response times for service quality
- Correlation of node and interface outages based on a Critical Service

The following image shows the model and representation of availability and response time.

![Diagram showing availability and response time](image)

**Figure 21. Representation of latency measurement and availability**

This information is based on Service Monitors which are scheduled and executed by Pollerd. A Service can have any arbitrary name and is associated with a Service Monitor. For example, we can define two Services with the name HTTP and HTTP-8080, both are associated with the HTTP Service Monitor but use a different TCP port configuration parameter. The following figure shows how Pollerd interacts with other components in OpenNMS and applications or agents to be monitored.

The availability is calculated over the last 24 hours and is shown in the Surveillance Views, SLA Categories and the Node Detail Page. Response times are displayed as Resource Graphs of the IP Interface on the Node Detail Page. Configuration parameters of the Service Monitor can be seen in the Service Page by clicking on the Service Name on the Node Detail Page. The status of a Service can be Up or Down.
The Service Page also includes timestamps indicating the last time at which the service was polled and found to be *Up* (Last Good) or *Down* (Last Fail). These fields can be used to validate that *Pollerd* is polling the services as expected.

When a Service Monitor detects an outage, *Pollerd* sends an Event which is used to create an Alarm. Events can also be used to generate Notifications for on-call network or server administrators. The following images shows the interaction of *Pollerd* in OpenNMS Horizon.

![Diagram showing Pollerd in OpenNMS Horizon](image)

**Figure 22. Service assurance with Pollerd in OpenNMS platform**

*Pollerd* can generate the following Events in *OpenNMS Horizon*:

<table>
<thead>
<tr>
<th>Event name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uei.opennms.org/nodes/nodeLostService</td>
<td>Critical Services are still up, just this service is lost.</td>
</tr>
<tr>
<td>uei.opennms.org/nodes/nodeRegainedService</td>
<td>Service came back up</td>
</tr>
<tr>
<td>uei.opennms.org/nodes/interfaceDown</td>
<td>Critical Service on an IP interface is down or all services are down.</td>
</tr>
<tr>
<td>uei.opennms.org/nodes/interfaceUp</td>
<td>Critical Service on that interface came back up again</td>
</tr>
<tr>
<td>uei.opennms.org/nodes/nodeDown</td>
<td>All critical services on all IP interfaces are down from node. The whole host is unreachable over the network.</td>
</tr>
<tr>
<td>uei.opennms.org/nodes/nodeUp</td>
<td>Some of the Critical Services came back online.</td>
</tr>
</tbody>
</table>

The behavior to generate `interfaceDown` and `nodeDown` events is described in the Critical Service section.

![Info icon](image)

This assumes that node-outage processing is enabled.

### 5.1. Pollerd Configuration

*Table 8. Configuration and log files related to Pollerd.*

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$OPENNMS_HOME/etc/poller-configuration.xml</td>
<td>Configuration file for monitors and global daemon configuration</td>
</tr>
<tr>
<td>File</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>$OPENNMS_HOME/logs/poller.log</td>
<td>Log file for all monitors and the global Pollerd</td>
</tr>
<tr>
<td>$OPENNMS_HOME/etc/response-graph.properties</td>
<td>RRD graph definitions for service response time measurements</td>
</tr>
<tr>
<td>$OPENNMS_HOME/etc/events/opennms.events.xml</td>
<td>Event definitions for Pollerd, i.e. nodeLostService, interfaceDown or nodeDown</td>
</tr>
</tbody>
</table>

To change the behavior for service monitoring, the poller-configuration.xml can be modified. The configuration file is structured in the following parts:

- **Global daemon config**: Define the size of the used Thread Pool to run Service Monitors in parallel. Define and configure the Critical Service for Node Event Correlation.
- **Polling packages**: Package to allow grouping of configuration parameters for Service Monitors.
- **Downtime Model**: Configure the behavior of Pollerd to run tests in case of an Outage is detected.
- **Monitor service association**: Based on the name of the service, the implementation for application or network management protocols are assigned.

**Global configuration parameters for Pollerd**

```xml
<poller-configuration threads="30" ①
  pathOutageEnabled="false" ②
  serviceUnresponsiveEnabled="false"> ③
</poller-configuration>
```

① Size of the Thread Pool to run Service Monitors in parallel.

② Enable or Disable Path Outage functionality based on a Critical Node in a network path.

③ In case of unresponsive service services a serviceUnresponsive event is generated and not an outage. This prevents the application of the Downtime Model in retesting the service after 30 seconds to help prevent false alarms.

Configuration changes are applied by restarting OpenNMS and Pollerd. It is also possible to send an Event to Pollerd reloading the configuration. An Event can be sent on the CLI or the Web User Interface.

**Send configuration reload event on CLI**

```
cd $OPENNMS_HOME/bin
./send-event.pl uei.opennms.org/internal/reloadDaemonConfig --parm 'daemonName Pollerd'
```
5.1.1. Meta-Data-DSL

Each parameter value can leverage dynamic configuration by using the Meta-Data-DSL.

During evaluation of an expression the following scopes are available:

- Node meta-data
5.2. Critical Service

Monitoring services on an IP network can be resource expensive, especially in cases where many of these services are not available. When a service is offline, or unreachable, the monitoring system spends most of it's time waiting for retries and timeouts.

In order to improve efficiency, OpenNMS Horizon deems all services on an interface to be Down if the critical service is Down. By default OpenNMS Horizon uses ICMP as the critical service.

The following image shows, how a Critical Services is used to generate these events.

Figure 24. Service assurance with Pollerd in OpenNMS Horizon platform

- (1) Critical services are all Up on the Node and just a nodeLostService is sent.
- (2) Critical service of one of many IP interface is Down and interfaceDown is sent. All other services are not tested and no events are sent, the services are assumed as unreachable.
- (3) All Critical services on the Node are Down and just a nodeDown is sent. All other services on the other IP Interfaces are not tested and no events are sent, these services are assumed as unreachable.

The Critical Service is used to correlate outages from Services to a nodeDown or interfaceDown event. It is a global configuration of Pollerd defined in poller-configuration.xml. The OpenNMS Horizon default configuration enables this behavior.
Critical Service Configuration in Pollerd

```
<poller-configuration
    threads="30"
    pathOutageEnabled="false"
    serviceUnresponsiveEnabled="false">
    <node-outage
        status="on" ①
        pollAllIfNoCriticalServiceDefined="true"> ②
        <critical-service name="ICMP"> ③</critical-service>
    </node-outage>
</poller-configuration>
```

① Enable Node Outage correlation based on a Critical Service

② Optional: In case of nodes without a Critical Service this option controls the behavior. If set to true then all services will be polled. If set to false then the first service in the package that exists on the node will be polled until service is restored, and then polling will resume for all services.

③ Define Critical Service for Node Outage correlation

5.3. Downtime Model

By default the monitoring interval for a service is 5 minutes. To detect also short services outages, caused for example by automatic network rerouting, the downtime model can be used. On a detected service outage, the interval is reduced to 30 seconds for 5 minutes. If the service comes back within 5 minutes, a shorter outage is documented and the impact on service availability can be less than 5 minutes. This behavior is called Downtime Model and is configurable.

![Downtime Model Diagram](image)

**Figure 25. Downtime model with resolved and ongoing outage**

In figure Outages and Downtime Model there are two outages. The first outage shows a short outage which was detected as up after 90 seconds. The second outage is not resolved now and the monitor has not detected an available service and was not available in the first 5 minutes (10 times 30 second polling). The scheduler changed the polling interval back to 5 minutes.
Example default configuration of the Downtime Model

```
<downtime interval="30000" begin="0" end="300000" /> <!-- 30s, 0, 5m -->
<downtime interval="300000" begin="300000" end="43200000" /> <!-- 5m, 5m, 12h -->
<downtime interval="600000" begin="43200000" end="432000000" /> <!-- 10m, 12h, 5d -->
<downtime interval="3600000" begin="432000000" delete="never" /> <!-- 1h, 5d -->
```

① from 0 seconds after an outage is detected until 5 minutes, the polling interval will be set to 30 seconds
② after 5 minutes of an ongoing outage until 12 hours, the polling interval will be set to 5 minutes
③ after 12 hours of an ongoing outage until 5 days, the polling interval will be set to 10 minutes
④ after 5 days of an ongoing outage the service will be polled only once a hour and we do not delete services

The last downtime interval can have an attribute `delete` and allows you to influence the service lifecycle. It defines the behavior that happens if a service doesn’t come back online after 5 days. The following downtime attributes for `delete` can be used:

<table>
<thead>
<tr>
<th>Value</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>never</td>
<td>services will never be deleted automatically</td>
</tr>
<tr>
<td>managed</td>
<td>only managed services will be deleted</td>
</tr>
<tr>
<td>always</td>
<td>managed and unmanaged services will be deleted</td>
</tr>
<tr>
<td>not set</td>
<td>if <code>delete</code> is not configured it is similar to <code>delete=&quot;never&quot;</code> and is the default</td>
</tr>
</tbody>
</table>

### 5.4. Path Outages

An outage of a central network component can cause a lot of node outages. *Path Outages* can be used to suppress *Notifications* based on how *Nodes* depend on each other in the network which are defined in a *Critical Path*. The *Critical Path* needs to be configured from the network perspective of the monitoring system. By default the *Path Outage* feature is disabled and has to be enabled in the `poller-configuration.xml`.

The following image shows an example network topology.
From the perspective of the monitoring system, a Router named `default-gw-01` is on the Critical Path to reach two networks. If Router `default-gw-01` is down, it is not possible to reach any node in the two networks behind and they will be all unreachable as well. In this case an administrator would like to have just one notification for `default-gw-01` and not for all the other Nodes behind. Building this configuration in OpenNMS Horizon requires the following information:

- **Parent Foreign Source**: The Foreign Source where the parent node is defined.
- **Parent Foreign ID**: The Foreign ID of the parent Node where this node depends on.
- **The IP Interface selected as Primary** is used as Critical IP

In this example we have created all Nodes in a Provisioning Requisition named `Network-ACME` and we use as the Foreign ID the same as the Node Label.

In the Web UI go to **Admin → Configure OpenNMS → Manage Provisioning Requisitions → Edit the Requisition → Edit the Node → Path Outage** to configure the network path by setting the Parent Foreign Source, Parent Foreign ID and Provisioned Node.

### Table 9. Provisioning for Topology Example

<table>
<thead>
<tr>
<th>Parent Foreign Source</th>
<th>Parent Foreign ID</th>
<th>Provisioned Node</th>
</tr>
</thead>
<tbody>
<tr>
<td>not defined</td>
<td>not defined</td>
<td>default-gw-01</td>
</tr>
<tr>
<td>Network-ACME</td>
<td>default-gw-01</td>
<td>node-01</td>
</tr>
<tr>
<td>Network-ACME</td>
<td>default-gw-01</td>
<td>node-02</td>
</tr>
<tr>
<td>Network-ACME</td>
<td>default-gw-02</td>
<td>default-gw02</td>
</tr>
<tr>
<td>Network-ACME</td>
<td>default-gw-02</td>
<td>node-03</td>
</tr>
</tbody>
</table>
The IP Interface which is set to Primary is selected as the Critical IP. In this example it is important the IP interface on default-gw-01 in the network 192.168.1.0/24 is set as Primary interface. The IP interface in the network 172.23.42.0/24 on default-gw-02 is set as Primary interface.

5.5. Poller Packages

To define more complex monitoring configuration it is possible to group Service configurations into Polling Packages. They allow to assign to Nodes different Service Configurations. To assign a Polling Package to nodes the Rules/Filters syntax can be used. Each Polling Package can have its own Downtime Model configuration.

Multiple packages can be configured, and an interface can exist in more than one package. This gives great flexibility to how the service levels will be determined for a given device.

Polling package assigned to Nodes with Rules and Filters

```
<package name="example1">①
 <filter>IPADDR != '0.0.0.0'</filter>②
 <include-range begin="1.1.1.1" end="254.254.254.254" />
 <include-range begin="::1" end="ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff" />
③
```

① Unique name of the polling package.

② Filter can be based on IP address, categories or asset attributes of Nodes based on Rules/Filters. The filter is evaluated first and is required. This package is used for all IP Interfaces which don’t have 0.0.0.0 as an assigned IP address and is required.

③ Allow to specify if the configuration of Services is applied on a range of IP Interfaces (IPv4 or IPv6).

Instead of the include-range it is possible to add one or more specific IP-Interfaces with:

Defining a specific IP Interfaces

```
<specific>192.168.1.59</specific>
```

It is also possible to exclude IP Interfaces with:

Exclude IP Interfaces

```
<exclude-range begin="192.168.0.100" end="192.168.0.104"/>
```
5.5.1. Response Time Configuration

The definition of Polling Packages allows to configure similar services with different polling intervals. All the response time measurements are persisted in RRD Files and require a definition. Each Polling Package contains a RRD definition.

RRD configuration for Polling Package example1

```xml
  <package name="example1">
    <filter>IPADDR != '0.0.0.0'</filter>
    <include-range begin="1.1.1.1" end="254.254.254.254" />
    <include-range begin="::1" end="ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff" />
    <rrd step="300">
      <rra>RRA:AVERAGE:0.5:1:2016</rra>①
      <rra>RRA:AVERAGE:0.5:12:1488</rra>②
      <rra>RRA:AVERAGE:0.5:288:366</rra>③
      <rra>RRA:MAX:0.5:288:366</rra>④
      <rra>RRA:MIN:0.5:288:366</rra>⑤
    </rrd>
  </package>
```

① Polling interval for all services in this Polling Package is reflected in the step of size 300 seconds. All services in this package have to polled in 5 min interval, otherwise response time measurements are not correct persisted.

② 1 step size is persisted 2016 times: 1 * 5 min * 2016 = 7 d, 5 min accuracy for 7 d.

③ 12 steps average persisted 1488 times: 12 * 5 min * 1488 = 62 d, aggregated to 60 min for 62 d.

④ 288 steps average persisted 366 times: 288 * 5 min * 366 = 366 d, aggregated to 24 h for 366 d.

⑤ 288 steps maximum from 24 h persisted for 366 d.

⑥ 288 steps minimum from 24 h persisted for 366 d.

⚠️ The RRD configuration and the service polling interval has to be aligned. In other cases the persisted response time data is not correct displayed in the response time graph.

⚠️ If the polling interval is changed afterwards, existing RRD files needs to be recreated with the new definitions.

5.5.2. Overlapping Services

With the possibility of specifying multiple Polling Packages it is possible to use the same Service like ICMP multiple times. The order how Polling Packages in the poller-configuration.xml are defined is important when IP Interfaces match multiple Polling Packages with the same Service configuration.

The following example shows which configuration is applied for a specific service:
Overwriting

```xml
<package name="less-specific">
  <filter>IPADDR != '0.0.0.0'</filter>
  <include-range begin="1.1.1.1" end="254.254.254.254" />
  <include-range begin="::1" end="ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff" />
  <rrd step="300">①</rrd>
    <rra>RRA:AVERAGE:0.5:1:2016</rra>
    <rra>RRA:AVERAGE:0.5:12:1488</rra>
    <rra>RRA:AVERAGE:0.5:288:366</rra>
    <rra>RRA:MAX:0.5:288:366</rra>
    <rra>RRA:MIN:0.5:288:366</rra>

  <service name="ICMP" interval="300000" user-defined="false" status="on">②</service>
    <parameter key="retry" value="5" />③
    <parameter key="timeout" value="10000" />④
    <parameter key="rrd-repository" value="/var/lib/opennms/rrd/response" />
    <parameter key="rrd-base-name" value="icmp" />
    <parameter key="ds-name" value="icmp" />
</service>
  <downtime interval="30000" begin="0" end="300000" />
  <downtime interval="300000" begin="300000" end="43200000" />
  <downtime interval="600000" begin="43200000" end="432000000" />
</package>

<package name="more-specific">
  <filter>IPADDR != '0.0.0.0'</filter>
  <include-range begin="192.168.1.1" end="192.168.1.254" />
  <include-range begin="2600::1" end="2600:::ffff" />
  <rrd step="30">①</rrd>
    <rra>RRA:AVERAGE:0.5:1:2016</rra>
    <rra>RRA:AVERAGE:0.5:12:1488</rra>
    <rra>RRA:AVERAGE:0.5:288:366</rra>
    <rra>RRA:MAX:0.5:288:366</rra>
    <rra>RRA:MIN:0.5:288:366</rra>

  <service name="ICMP" interval="300000" user-defined="false" status="on">②</service>
    <parameter key="retry" value="2" />③
    <parameter key="timeout" value="3000" />④
    <parameter key="rrd-repository" value="/var/lib/opennms/rrd/response" />
    <parameter key="rrd-base-name" value="icmp" />
    <parameter key="ds-name" value="icmp" />
</service>
  <downtime interval="10000" begin="0" end="300000" />
  <downtime interval="300000" begin="300000" end="43200000" />
  <downtime interval="600000" begin="43200000" end="432000000" />
</package>
```

① Polling interval in the packages are 300 seconds and 30 seconds

② Different polling interval for the service ICMP
Different retry settings for the service **ICMP**

Different timeout settings for the service **ICMP**

The last **Polling Package** on the service will be applied. This can be used to define a less specific catch all filter for a default configuration. A more specific **Polling Package** can be used to overwrite the default setting. In the example above all **IP Interfaces** in 192.168.1/24 or 2600:/64 will be monitored with ICMP with different polling, retry and timeout settings.

Which **Polling Packages** are applied to the **IP Interface** and **Service** can be found in the **Web User Interface**. The **IP Interface** and **Service** page show which **Polling Package** and **Service** configuration is applied for this specific service.

![Figure 27. Polling Package applied to IP interface and Service](image)

### 5.5.3. Service Patterns

Usually, the **Poller** used to monitor a **Service** is found by the matching the pollers name with the service name. In addition, a matching poller can be found if an additional element **pattern** is specified for the poller. If so, the poller is used for all services matching the **RegEx** pattern, too.

The **RegEx** pattern allows to specify named capture groups. There can be multiple capture groups inside of a pattern, but each must have a unique name. Please note, that the **RegEx** must be escaped or be wrapped in a CDATA-Tag inside the configuration XML to make it a valid property.

If a poller is matched using its pattern, the parts of the service name which matches the capture groups of the pattern are available as parameters to the **Meta-Data-DSL** using the context **pattern** and the capture group name as key.

Examples:

```xml
<pattern><![CDATA[^HTTP-(?<vhost>.*)$]]></pattern>
```

Matches all services which names starts with **HTTP-** followed by a host name. If the services is called **HTTP-www.example.com**, the Meta-DSL expression **${pattern:vhost}** will resolved to
Matches all services which names starts with HTTP- followed by a hostname and a port. There will be two variables (${pattern:vhost} and ${pattern:port}) which can be used in the poller parameters.

The service pattern mechanism can be used to whenever there are multiple instances of a service on the same interface. By specifying a distinct service name to each instance, the services is identifiable, but there is no need to add a poller definition per service. Common use-cases for such services are HTTP Virtual Hosts, where multiple web applications run on the same web-server or BGP session monitoring where each router has multiple neighbours.

5.5.4. Test Services on manually

For troubleshooting it is possible to run a test via the Karaf Shell:

```
ssh -p 8101 admin@localhost
```

Once in the shell, you can print show the commands help as follows:
opennms> opennms:poll --help
DESCRIPTION
opennms:poll

Used to invoke a monitor against a host at a specified location

SYNTAX
opennms:poll [options] host [attributes]

ARGUMENTS
host
    Hostname or IP Address of the system to poll
    (required)
attributes
    Monitor specific attributes in key=value form

OPTIONS
    --help
        Display this help message
    -l, --location
        Location
        (defaults to Default)
    -s, --system-id
        System ID
    -t, --ttl
        Time to live
    -P, --package
        Poller Package
    -S, --service
        Service name
    -n, --node-id
        Node Id for Service
    -c, --class
        Monitor Class

The following example runs the ICMP monitor on a specific IP Interface.

Run ICMP monitor configuration defined in specific Polling Package

opennms> opennms:poll -S ICMP -P example1 10.23.42.1

The output is verbose which allows debugging of Monitor configurations. Important output lines are shown as the following:
Important output testing a service on the CLI

Package: example1 ①
Service: ICMP ②
Monitor: org.opennms.netmgt.poller.monitors.IcmpMonitor ③
Parameter ds-name: icmp ④
Parameter retry: 2 ⑤
Parameter rrd-base-name: icmp ④
Parameter rrd-repository: /opt/opennms/share/rrd/response ④
Parameter timeout: 3000 ⑤

Service is Up on 192.168.31.100 using org.opennms.netmgt.poller.monitors.IcmpMonitor:
response-time: 407,000 ⑦

① Service and Package of this test
② Applied Service configuration from Polling Package for this test
③ Service Monitor used for this test
④ RRD configuration for response time measurement
⑤ Retry and timeout settings for this test
⑥ Polling result for the service polled against the IP address
⑦ Response time

5.5.5. Test filters on Karaf Shell

Filters are ubiquitous in opennms configurations with <filter> syntax. This karaf shell can be used to verify filters. For more info, refer to Filters.

ssh -p 8101 admin@localhost

Once in the shell, print command help as follows

```
opennms> opennms:filter --help
DESCRIPTION
opennms:filter
Enumerates nodes/interfaces that match a give filter
SYNTAX
opennms:filter filterRule
ARGUMENTS
filterRule
   A filter Rule
```

For ex: Run a filter rule that match a location
5.6. Service monitors

To support several specific applications and management agents, Pollerd executes Service Monitors. This section describes all available built-in Service Monitors which are available and can be configured to allow complex monitoring. For information how these can be extended, see Development Guide of the OpenNMS documentation.
5.6.1. Common Configuration Parameters

Application or Device specific Monitors are based on a generic API which provide common configuration parameters. These minimal configuration parameters are available in all Monitors and describe the behavior for timeouts, retries, etc.

Table 10. Common implemented configuration parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>retry</td>
<td>Number of attempts to test a Service to be up or down.</td>
<td>optional</td>
<td>3</td>
</tr>
<tr>
<td>timeout</td>
<td>Timeout for the isReachable method, in milliseconds.</td>
<td>optional</td>
<td>3000</td>
</tr>
<tr>
<td>invert-status</td>
<td>Invert the up/down behavior of the monitor</td>
<td>optional</td>
<td>false</td>
</tr>
</tbody>
</table>

In case the Monitor is using the SNMP Protocol the default configuration for timeout and retry are used from the SNMP Configuration (snmp-config.xml).

Minion Configuration Parameters

When nodes are configured with a non-default location, the associated Service Monitors are executed on a Minion configured with that same location. If there are many Minions at a given location, the Service Monitor may be executed on any of the Minions that are currently available. Users can choose to execute a Service Monitor on a specific Minion, by specifying the System ID of the Minion. This mechanism is used for monitoring the Minions individually.

The following parameters can be used to override this behavior and control where the Service Monitors are executed.

Table 11. Minion configuration parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>Specify the location at which the Service Monitor should be executed.</td>
<td>optional</td>
<td>(The location of the associated node)</td>
</tr>
<tr>
<td>system-id</td>
<td>Specify the System ID on which the Service Monitor should be executed</td>
<td>optional</td>
<td>(None)</td>
</tr>
<tr>
<td>use-foreign-id-as-system-id</td>
<td>Use the foreign id of the associated node as the System ID</td>
<td>optional</td>
<td>false</td>
</tr>
</tbody>
</table>

When specifying a System ID the location should also be set to the corresponding location for that system.

5.6.2. Using Placeholders in Parameters

Some monitor parameters support placeholder substitution. You can reference some node,
interface, and asset record properties by enclosing them in { and }. The supported properties are:

- `nodeId`
- `nodeLabel`
- `foreignSource`
- `foreignId`
- `ipAddr` (or `ipAddress`)
- all node asset record fields (e.g. `username`, `password`)

Parameters that support placeholder substitution are marked 'Yes' in the 'Placeholder substitution' column of the Configuration and Usage section of the monitor documentation.

### 5.6.3. ActiveMQMonitor

This monitor tests the availability of an ActiveMQ Broker. The service is considered available if a successful connection is made.

#### Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.ActiveMQMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>true or false if the monitor can be used by the OpenNMS Horizon remote poller</td>
</tr>
</tbody>
</table>

#### Configuration and Usage

**Table 12. Monitor specific parameters for the ActiveMQMonitor**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>broker-url</td>
<td>The ActiveMQ Broker URL to connect to.</td>
<td>required</td>
<td><code>vm://localhost?create=false&amp;broker.persistent=false</code></td>
</tr>
<tr>
<td>user</td>
<td>The user name used to login to the ActiveMQ broker.</td>
<td>optional</td>
<td>-</td>
</tr>
<tr>
<td>password</td>
<td>The password used to authenticate the user on the ActiveMQ broker.</td>
<td>optional</td>
<td>-</td>
</tr>
<tr>
<td>use-nodelabel</td>
<td>A boolean to enable using the nodelabel when connecting to the ActiveMQ broker.</td>
<td>optional</td>
<td><code>false</code></td>
</tr>
<tr>
<td>create-session</td>
<td>A boolean to enable creating a JMS Session when connecting to the ActiveMQ broker.</td>
<td>optional</td>
<td><code>false</code></td>
</tr>
<tr>
<td>client-id</td>
<td>The client ID to use when connecting to the ActiveMQ broker.</td>
<td>optional</td>
<td>-</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.
Examples

Some example configuration how to configure the monitor in the poller-configuration.xml:

```xml
<parameter key="broker-url" value="failover://auto+ssl://192.168.1.1:61616/"/>
<parameter key="use-nodelabel" value="true"/>
```

5.6.4. AvailabilityMonitor

This monitor tests reachability of a node by using the `isReachable` method of the `InetAddress` java class. The service is considered available if `isReachable` returns true. See Oracle's documentation for more details.

⚠️ This monitor is deprecated in favour of the IcmpMonitor monitor. You should only use this monitor on remote pollers running on unusual configurations (See below for more details).

Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.AvailabilityMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>true</td>
</tr>
</tbody>
</table>

Configuration and Usage

This monitor implements the Common Configuration Parameters.

Examples

```xml
<service name="AVAIL" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="2"/>
  <parameter key="timeout" value="5000"/>
</service>

<monitor service="AVAIL" class-name="org.opennms.netmgt.poller.monitors.AvailabilityMonitor"/>
```

IcmpMonitor vs AvailabilityMonitor

This monitor has been developed in a time when the IcmpMonitor monitor wasn't remote enabled, to circumvent this limitation. Now, with the JNA ICMP implementation, the IcmpMonitor monitor is remote enabled under most configurations and this monitor shouldn't be needed unless you're running your remote poller on such an unusual configuration (See also issue NMS-6735 for more information).
5.6.5. BgpSessionMonitor

This monitor checks if a BGP-Session to a peering partner (peer-ip) is functional. To monitor the BGP-Session the RFC1269 SNMP MIB is used and test the status of the session using the following OIDs is used:

- `BGP_PEER_STATE_OID = .1.3.6.1.2.1.15.3.1.2.<peer-ip>`
- `BGP_PEER_ADMIN_STATE_OID = .1.3.6.1.2.1.15.3.1.3.<peer-ip>`
- `BGP_PEER_REMOTEAS_OID = .1.3.6.1.2.1.15.3.1.9.<peer-ip>`
- `BGP_PEER_LAST_ERROR_OID = .1.3.6.1.2.1.15.3.1.14.<peer-ip>`
- `BGP_PEER_FSM_EST_TIME_OID = .1.3.6.1.2.1.15.3.1.16.<peer-ip>`

The `<peer-ip>` is the far end IP address of the BGP session end point.

A SNMP get request for `BGP_PEER_STATE_OID` returns a result between 1 to 6. The servicestates for OpenNMS Horizon are mapped as follows:

<table>
<thead>
<tr>
<th>Result</th>
<th>State Description</th>
<th>Monitor State in OpenNMS Horizon</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Idle</td>
<td>DOWN</td>
</tr>
<tr>
<td>2</td>
<td>Connect</td>
<td>DOWN</td>
</tr>
<tr>
<td>3</td>
<td>Active</td>
<td>DOWN</td>
</tr>
<tr>
<td>4</td>
<td>OpenSent</td>
<td>DOWN</td>
</tr>
<tr>
<td>5</td>
<td>OpenConfirm</td>
<td>DOWN</td>
</tr>
<tr>
<td>6</td>
<td>Established</td>
<td>UP</td>
</tr>
</tbody>
</table>

**Monitor facts**

<table>
<thead>
<tr>
<th>Class Name</th>
<th></th>
<th><code>org.opennms.netmgt.poller.monitors.BgpSessionMonitor</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

To define the mapping I used the description from RFC1771 BGP Finite State Machine.

**Configuration and Usage**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bgpPeerIp</code></td>
<td>IP address of the far end BGP peer session</td>
<td>required</td>
<td>-</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.
Examples

To monitor the session state *Established* it is necessary to add a service to your poller configuration in '$OPENNMS_HOME/etc/poller-configuration.xml', for example:

```xml
<!-- Example configuration poller-configuration.xml -->
<service
   name="BGP-Peer-99.99.99.99-AS65423"
   interval="300000"
   user-defined="false"
   status="on">
   <parameter
      key="retry"
      value="2"/>
   <parameter
      key="timeout"
      value="3000"/>
   <parameter
      key="port"
      value="161"/>
   <parameter
      key="bgpPeerIp"
      value="99.99.99.99"/>
</service>

<monitor
   service="BGP-Peer-99.99.99.99-AS65423"
   class-name="org.opennms.netmgt.poller.monitors.BgpSessionMonitor"/>
```

Error code mapping

The *BGP_PEER_LAST_ERROR_OID* gives an error in HEX-code. To make it human readable a codemapping table is implemented:

<table>
<thead>
<tr>
<th>Error code</th>
<th>Error Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>0100</td>
<td>Message Header Error</td>
</tr>
<tr>
<td>0101</td>
<td>Message Header Error - Connection Not Synchronized</td>
</tr>
<tr>
<td>0102</td>
<td>Message Header Error - Bad Message Length</td>
</tr>
<tr>
<td>0103</td>
<td>Message Header Error - Bad Message Type</td>
</tr>
<tr>
<td>0200</td>
<td>OPEN Message Error</td>
</tr>
<tr>
<td>0201</td>
<td>OPEN Message Error - Unsupported Version Number</td>
</tr>
<tr>
<td>0202</td>
<td>OPEN Message Error - Bad Peer AS</td>
</tr>
<tr>
<td>0203</td>
<td>OPEN Message Error - Bad BGP Identifier</td>
</tr>
<tr>
<td>0204</td>
<td>OPEN Message Error - Unsupported Optional Parameter</td>
</tr>
<tr>
<td>0205</td>
<td>OPEN Message Error (deprecated)</td>
</tr>
<tr>
<td>0206</td>
<td>OPEN Message Error - Unacceptable Hold Time</td>
</tr>
<tr>
<td>0300</td>
<td>UPDATE Message Error</td>
</tr>
<tr>
<td>0301</td>
<td>UPDATE Message Error - Malformed Attribute List</td>
</tr>
<tr>
<td>0302</td>
<td>UPDATE Message Error - Unrecognized Well-known Attribute</td>
</tr>
<tr>
<td>0303</td>
<td>UPDATE Message Error - Missing Well-known Attribute</td>
</tr>
<tr>
<td>Error code</td>
<td>Error Message</td>
</tr>
<tr>
<td>------------</td>
<td>---------------</td>
</tr>
<tr>
<td>0304</td>
<td>UPDATE Message Error - Attribute Flags Error</td>
</tr>
<tr>
<td>0305</td>
<td>UPDATE Message Error - Attribute Length Error</td>
</tr>
<tr>
<td>0306</td>
<td>UPDATE Message Error - Invalid ORIGIN Attribute</td>
</tr>
<tr>
<td>0307</td>
<td>UPDATE Message Error (deprecated)</td>
</tr>
<tr>
<td>0308</td>
<td>UPDATE Message Error - Invalid NEXT_HOP Attribute</td>
</tr>
<tr>
<td>0309</td>
<td>UPDATE Message Error - Optional Attribute Error</td>
</tr>
<tr>
<td>030A</td>
<td>UPDATE Message Error - Invalid Network Field</td>
</tr>
<tr>
<td>030B</td>
<td>UPDATE Message Error - Malformed AS_PATH</td>
</tr>
<tr>
<td>0400</td>
<td>Hold Timer Expired</td>
</tr>
<tr>
<td>0500</td>
<td>Finite State Machine Error</td>
</tr>
<tr>
<td>0600</td>
<td>Cease</td>
</tr>
<tr>
<td>0601</td>
<td>Cease - Maximum Number of Prefixes Reached</td>
</tr>
<tr>
<td>0602</td>
<td>Cease - Administrative Shutdown</td>
</tr>
<tr>
<td>0603</td>
<td>Cease - Peer De-configured</td>
</tr>
<tr>
<td>0604</td>
<td>Cease - Administrative Reset</td>
</tr>
<tr>
<td>0605</td>
<td>Cease - Connection Rejected</td>
</tr>
<tr>
<td>0606</td>
<td>Cease - Other Configuration Change</td>
</tr>
<tr>
<td>0607</td>
<td>Cease - Connection Collision Resolution</td>
</tr>
<tr>
<td>0608</td>
<td>Cease - Out of Resources</td>
</tr>
</tbody>
</table>

Instead of HEX-Code the error message will be displayed in the service down logmessage. To give some additional informations the logmessage contains also:

BGP-Peer Adminstate
BGP-Peer Remote AS
BGP-Peer established time in seconds

**Debugging**

If you have problems to detect or monitor the BGP Session you can use the following command to figure out where the problem come from.

```
snmpwalk -v 2c -c <myCommunity> <myRouter2Monitor> .1.3.6.1.2.1.15.3.1.2.99.99.99.99
```
Replace 99.99.99.99 with your BGP-Peer IP. The result should be an Integer between 1 and 6.

5.6.6. BSFMonitor

This monitor runs a Bean Scripting Framework BSF compatible script to determine the status of a service. Users can write scripts to perform highly custom service checks. This monitor is not optimised for scale. It's intended for a small number of custom checks or prototyping of monitors.

BSFMonitor vs SystemExecuteMonitor

The BSFMonitor avoids the overhead of fork(2) that is used by the SystemExecuteMonitor. BSFMonitor also grants access to a selection of OpenNMS Horizon internal methods and classes that can be used in the script.

Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.BSFMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>false</td>
</tr>
</tbody>
</table>

Configuration and Usage

Table 13. Monitor specific parameters for the BSFMonitor

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>file-name</td>
<td>Path to the script file.</td>
<td>required</td>
<td>-</td>
</tr>
<tr>
<td>run-type</td>
<td>one of eval or exec</td>
<td>optional</td>
<td>eval</td>
</tr>
<tr>
<td>lang-class</td>
<td>The BSF language class, like groovy or beanshell.</td>
<td>optional</td>
<td>file-name extension is interpreted by default</td>
</tr>
<tr>
<td>file-extension</td>
<td>comma-separated list</td>
<td>optional</td>
<td>-</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

Table 14. Beans which can be used in the script
<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>map</td>
<td>Map&lt;String, Object&gt;</td>
<td>The map contains all various parameters passed to the monitor from the service definition in the poller-configuration.xml file.</td>
</tr>
<tr>
<td>ip_addr</td>
<td>String</td>
<td>The IP address that is currently being polled.</td>
</tr>
<tr>
<td>node_id</td>
<td>int</td>
<td>The Node ID of the node the ip_addr belongs to.</td>
</tr>
<tr>
<td>node_label</td>
<td>String</td>
<td>The Node Label of the node the ip_addr and service belongs to.</td>
</tr>
<tr>
<td>svc_name</td>
<td>String</td>
<td>The name of the service that is being polled.</td>
</tr>
<tr>
<td>bsf_mon</td>
<td>BSFMonitor</td>
<td>The instance of the BSFMonitor object calling the script. Useful for logging via its log(String sev, String fmt, Object... args) method.</td>
</tr>
<tr>
<td>results</td>
<td>HashMap&lt;String, String&gt;</td>
<td>The script is expected to put its results into this object. The status indication should be set into the entry with key status. If the status is not OK, a key reason should contain a description of the problem.</td>
</tr>
<tr>
<td>times</td>
<td>LinkedHashMap&lt;String, Number&gt;</td>
<td>The script is expected to put one or more response times into this object.</td>
</tr>
</tbody>
</table>

Additionally every parameter added to the service definition in poller-configuration.xml is available as a String object in the script. The key attribute of the parameter represents the name of the String object and the value attribute represents the value of the String object.

Please keep in mind, that these parameters are also accessible via the map bean.

Avoid non-character names for parameters to avoid problems in the script languages.

**Response Codes**

The script has to provide a status code that represents the status of the associated service. The following status codes are defined:

*Table 15. Status codes*

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OK</td>
<td>Service is available</td>
</tr>
<tr>
<td>UNK</td>
<td>Service status unknown</td>
</tr>
<tr>
<td>UNR</td>
<td>Service is unresponsive</td>
</tr>
<tr>
<td>NOK</td>
<td>Service is unavailable</td>
</tr>
</tbody>
</table>
Response time tracking

By default the **BSFMonitor** tracks the whole time the script file consumes as the response time. If the response time should be persisted the response time add the following parameters:

**RRD response time tracking for this service in poller-configuration.xml**

```xml
<!-- where in the filesystem response times are stored -->
<parameter key="rrd-repository" value="/opt/opennms/share/rrd/response" />

<!-- name of the rrd file -->
<parameter key="rrd-base-name" value="minimalbshbase" />

<!-- name of the data source in the rrd file -->
<!-- by default "response-time" is used as ds-name -->
<parameter key="ds-name" value="myResponseTime" />
```

It is also possible to return one or many response times directly from the script. To add custom response times or override the default one, add entries to the `times` object. The entries are keyed with a `String` that names the datasource and have as values a number that represents the response time. To override the default response time datasource add an entry into `times` named `response-time`.

Timeout and Retry

The **BSFMonitor** does not perform any timeout or retry processing on its own. If retry and or timeout behaviour is required, it has to be implemented in the script itself.

Requirements for the script (run-types)

Depending on the `run-type` the script has to provide its results in different ways. For minimal scripts with very simple logic `run-type eval` is the simple option. Scripts running in `eval` mode have to return a `String` matching one of the `status` codes.

If your script is more than a one-liner, `run-type exec` is essentially required. Scripts running in `exec` mode need not return anything, but they have to add a `status` entry with a `status code` to the `results` object. Additionally, the `results` object can also carry a "reason":"message" entry that is used in non OK states.

Commonly used language settings

The **BSF** supports many languages, the following table provides the required setup for commonly used languages.

**Table 16. BSF language setups**

<table>
<thead>
<tr>
<th>Language</th>
<th>language-class</th>
<th>bsf-engine</th>
<th>required library</th>
</tr>
</thead>
<tbody>
<tr>
<td>BeanShell</td>
<td>beanshell</td>
<td>bsh.util.BeanShellBSFEngine</td>
<td>supported by default</td>
</tr>
<tr>
<td>Language</td>
<td>lang-class</td>
<td>bsf-engine</td>
<td>required library</td>
</tr>
<tr>
<td>----------</td>
<td>------------</td>
<td>------------</td>
<td>------------------</td>
</tr>
<tr>
<td>Groovy</td>
<td>groovy</td>
<td>org.codehaus.groovy.bsf.GroovyEngine</td>
<td>groovy-all-[version].jar</td>
</tr>
<tr>
<td>Jython</td>
<td>jython</td>
<td>org.apache.bsf.engines.jython.JythonEngine</td>
<td>jython-[version].jar</td>
</tr>
</tbody>
</table>

**Example Bean Shell**

BeanShell example poller-configuration.xml

```xml
<service name="MinimalBeanShell" interval="300000" user-defined="true" status="on">
  <parameter key="file-name" value="/tmp/MinimalBeanShell.bsh"/>
  <parameter key="bsf-engine" value="bsh.util.BeanShellBSFEngine"/>
</service>

<monitor service="MinimalBeanShell" class-name="org.opennms.netmgt.poller.monitors.BSFMonitor"/>
```

BeanShell example MinimalBeanShell.bsh script file

```java
bsf_monitor.log("ERROR", "Starting MinimalBeanShell.bsf", null);
File testFile = new File("/tmp/TestFile");
if (testFile.exists()) {
    return "OK";
} else {
    results.put("reason", "file does not exist");
    return "NOK";
}
```

**Example Groovy**

To use the Groovy language an additional library is required. Copy a compatible groovy-all.jar into to opennms/lib folder and restart OpenNMS Horizon. That makes Groovy available for the BSFMonitor.

Groovy example poller-configuration.xml with default run-type set to eval

```xml
<service name="MinimalGroovy" interval="300000" user-defined="true" status="on">
  <parameter key="file-name" value="/tmp/MinimalGroovy.groovy"/>
  <parameter key="bsf-engine" value="org.codehaus.groovy.bsf.GroovyEngine"/>
</service>

<monitor service="MinimalGroovy" class-name="org.opennms.netmgt.poller.monitors.BSFMonitor"/>
```
**Groovy example** MinimalGroovy.groovy script file for run-type eval

```groovy
bsf_monitor.log("ERROR", "Starting MinimalGroovy.groovy", null);
File testFile = new File("/tmp/TestFile");
if (testFile.exists()) {
    return "OK";
} else {
    results.put("reason", "file does not exist");
    return "NOK";
}
```

**Groovy example** poller-configuration.xml with run-type set to exec

```xml
<service name="MinimalGroovy" interval="300000" user-defined="true" status="on">
    <parameter key="file-name" value="/tmp/MinimalGroovy.groovy"/>
    <parameter key="bsf-engine" value="org.codehaus.groovy.bsf.GroovyEngine"/>
    <parameter key="run-type" value="exec"/>
</service>

<monitor service="MinimalGroovy" class-name="org.opennms.netmgt.poller.monitors.BSFMonitor" />
```

**Groovy example** MinimalGroovy.groovy script file for run-type set to exec

```groovy
def testFile = new File("/tmp/TestFile");
if (testFile.exists()) {
    results.put("status", "OK")
} else {
    results.put("reason", "file does not exist");
    results.put("status", "NOK");
}
```

**Example Jython**

To use the Jython (Java implementation of Python) language an additional library is required. Copy a compatible jython-x.y.z.jar into the opennms/lib folder and restart OpenNMS Horizon. That makes Jython available for the BSFMonitor.
**Jython example** poller-configuration.xml with run-type exec

```xml
<service name="MinimalJython" interval="300000" user-defined="true" status="on">
    <parameter key="file-name" value="/tmp/MinimalJython.py"/>
    <parameter key="bsf-engine" value="org.apache.bsf.engines.jython.JythonEngine"/>
    <parameter key="run-type" value="exec"/>
</service>

<monitor service="MinimalJython" class-name="org.opennms.netmgt.poller.monitors.BSFMonitor"/>
```

**Jython example** MinimalJython.py script file for run-type set to exec

```python
def main():

    import File
    bsf_monitor.log("ERROR", "Starting MinimalJython.py", None);
    if File("/tmp/TestFile").exists():
        results.put("status", "OK")
    else:
        results.put("reason", "file does not exist")
        results.put("status", "NOK")

from java.io import File

bsf_monitor.log("ERROR", "Starting MinimalJython.py", None);
if (File("/tmp/TestFile").exists()):
    results.put("status", "OK")
else:
    results.put("reason", "file does not exist")
    results.put("status", "NOK")
```

- We have to use `run-type exec` here because *Jython* chokes on the import keyword in `eval` mode.
- As proof that this is really *Python*, notice the substitution of *Python’s* None value for Java’s null in the log call.

**Advanced examples**

The following example references all beans that are exposed to the script, including a custom parameter.
Groovy example poller-configuration.xml

```xml
<service name="MinimalGroovy" interval="30000" user-defined="true" status="on">
  <parameter key="file-name" value="/tmp/MinimalGroovy.groovy" />
  <parameter key="bsf-engine" value="org.codehaus.groovy.bsf.GroovyEngine" />
  <!-- custom parameters (passed to the script) -->
  <parameter key="myParameter" value="Hello Groovy" />
  <!-- optional for response time tracking -->
  <parameter key="rrd-repository" value="/opt/opennms/share/rrd/response" />
  <parameter key="rrd-base-name" value="minimalgroovybase" />
  <parameter key="ds-name" value="minimalgroovyds" />
</service>

<monitor service="MinimalGroovy" class-name="org.opennms.netmgt.poller.monitors.BSFMonitor" />
```

Groovy example Bean referencing script file

```groovy
bsf_monitor.log("ERROR", "Starting MinimalGroovy", null);

//list of all available objects from the BSFMonitor
Map<String, Object> map = map;
bsf_monitor.log("ERROR", "---- map ----", null);

String ip_addr = ip_addr;
bsf_monitor.log("ERROR", "---- ip_addr ----", null);
bsf_monitor.log("ERROR", ip_addr, null);

int node_id = node_id;
bsf_monitor.log("ERROR", "---- node_id ----", null);
bsf_monitor.log("ERROR", node_id, null);

String node_label = node_label;
bsf_monitor.log("ERROR", "---- node_label ----", null);
bsf_monitor.log("ERROR", node_label, null);

String svc_name = svc_name;
bsf_monitor.log("ERROR", "---- svc_name ----", null);
bsf_monitor.log("ERROR", svc_name, null);

org.opennms.netmgt.poller.monitors.BSFMonitor bsf_monitor = bsf_monitor;
bsf_monitor.log("ERROR", "---- bsf_monitor ----", null);
bsf_monitor.log("ERROR", bsf_monitor, null);

HashMap<String, String> results = results;
bsf_monitor.log("ERROR", "---- results ----", null);
bsf_monitor.log("ERROR", results, null);
```
```java
LinkedHashMap<String, Number> times = times;
bsf_monitor.log("ERROR", "---- times ----", null);
bsf_monitor.log("ERROR", times.toString(), null);

// reading a parameter from the service definition
String myParameter = myParameter;
bsf_monitor.log("ERROR", "---- myParameter ----", null);
bsf_monitor.log("ERROR", myParameter, null);

// minimal example
def testFile = new File("/tmp/TestFile");
if (testFile.exists()) {
    bsf_monitor.log("ERROR", "Done MinimalGroovy ---- OK ----", null);
    return "OK";
} else {
    results.put("reason", "file does not exist");
    bsf_monitor.log("ERROR", "Done MinimalGroovy ---- NOK ----", null);
    return "NOK";
}
```

### 5.6.7. CiscoIpSlaMonitor

This monitor can be used to monitor IP SLA configurations on your Cisco devices. This monitor supports the following SNMP OIDS from **CISCO-RTT-MON-MIB**:

- `RTT_ADMIN_TAG_OID = .1.3.6.1.4.1.9.9.42.1.2.1.1.3`
- `RTT_OPER_STATE_OID = .1.3.6.1.4.1.9.9.42.1.2.9.1.10`
- `RTT_LATEST_OPERSENSE_OID = .1.3.6.1.4.1.9.9.42.1.2.10.1.2`
- `RTT_ADMIN_THRESH_OID = .1.3.6.1.4.1.9.9.42.1.2.1.1.5`
- `RTT_ADMIN_TYPE_OID = .1.3.6.1.4.1.9.9.42.1.2.1.1.4`
- `RTT_LATEST_OID = .1.3.6.1.4.1.9.9.42.1.2.10.1.1`

The monitor can be run in two scenarios. The first one tests the `RTT_LATEST_OPERSENSE` which is a sense code for the completion status of the latest RTT operation. If the `RTT_LATEST_OPERSENSE` returns `ok(1)` the service is marked as *up*.

The second scenario is to monitor the configured threshold in the *IP SLA* config. If the `RTT_LATEST_OPERSENSE` returns with `overThreshold(3)` the service is marked *down*.

### Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.CiscoIpSlaMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>false</td>
</tr>
</tbody>
</table>
Configuration and Usage

Table 17. Monitor-specific parameters for the CiscoIpSlaMonitor

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>admin-tag</td>
<td>The tag attribute from your IP SLA configuration you want to monitor.</td>
<td>required</td>
<td>-</td>
</tr>
<tr>
<td>ignore-thresh</td>
<td>Boolean indicates if just the status or configured threshold should be monitored.</td>
<td>required</td>
<td><code>None</code></td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

Example for HTTP and ICMP echo reply

In this example we configure an IP SLA entry to monitor Google’s website with HTTP GET from the Cisco device. We use 8.8.8.8 as our DNS resolver. In our example our SLA says we should reach Google’s website within 200ms. To advise co-workers that this monitor entry is used for monitoring, I set the owner to OpenNMS. The tag is used to identify the entry later in the SNMP table for monitoring.

Cisco device configuration for IP SLA instance for HTTP GET

```
ip sla monitor 1
  type http operation get url http://www.google.de name-server 8.8.8.8
  timeout 3000
  threshold 200
  owner OpenNMS
  tag Google Website
ip sla monitor schedule 3 life forever start-time now
```

In the second example we configure a IP SLA to test if the IP address from www.opennms.org is reachable with ICMP from the perspective of the Cisco device. Like the example above we have a threshold and a timeout.

Cisco device configuration for IP SLA instance for ICMP monitoring.

```
ip sla 1
  icmp-echo 64.146.64.212
  timeout 3000
  threshold 150
  owner OpenNMS
  tag OpenNMS Host
ip sla schedule 1 life forever start-time now
```

It’s not possible to reconfigure an IP SLA entry. If you want to change parameters, you have to delete the whole configuration and reconfigure it with your new parameters. Backup your Cisco configuration manually or take a look at RANCID.
To monitor both of the entries the configuration in `poller-configuration.xml` requires two service definition entries:

```xml
<service name="IP-SLA-WEB-Google" interval="300000"
user-defined="false" status="on">
  <parameter key="retry" value="2" />
  <parameter key="timeout" value="3000" />
  <parameter key="admin-tag" value="Google Website" />
  <parameter key="ignore-thresh" value="false" />①
</service>

<service name="IP-SLA-PING-OpenNMS" interval="300000"
user-defined="false" status="on">
  <parameter key="retry" value="2" />
  <parameter key="timeout" value="3000" />
  <parameter key="admin-tag" value="OpenNMS Host" />
  <parameter key="ignore-thresh" value="true" />②
</service>

<monitor service="IP-SLA-WEB-Google" class-name="org.opennms.netmgt.poller.monitors.CiscoIpSlaMonitor" />
<monitor service="IP-SLA-PING-OpenNMS" class-name="org.opennms.netmgt.poller.monitors.CiscoIpSlaMonitor" />
```

① Service is *up* if the IP SLA state is *ok*(1)

② Service is *down* if the IP SLA state is *overThreshold*(3)

### 5.6.8. CiscoPingMibMonitor

This poller monitor's purpose is to create conceptual rows (entries) in the `ciscoPingTable` on Cisco IOS devices that support the `CISCO-PING-MIB`. These entries direct the remote IOS device to ping an IPv4 or IPv6 address with a configurable set of parameters. After the IOS device has completed the requested ping operations, the poller monitor queries the IOS device to determine the results. If the results indicate success according to the configured parameters in the service configuration, then the monitored service is reported as available and the results are available for optional time-series (RRD) storage. If the results indicate failure, the monitored service is reported unavailable with a descriptive reason code. If something goes wrong during the setup of the entry or the subsequent querying of its status, the monitored service is reported to be in an *unknown* state.

Unlike most poller monitors, the `CiscoPingMibMonitor` does not interpret the `timeout` and `retries` parameters to determine when a poll attempt has timed out or whether it should be attempted again. The `packet-count` and `packet-timeout` parameters instead service this purpose from the perspective of the remote IOS device.
Supported MIB OIDs from CISCO_PING_MIB

Prerequisites

- One or more Cisco devices running an IOS image of recent vintage; any 12.2 or later image is probably fine. Even very low-end devices appear to support the CISCO-PING-MIB.

- The IOS devices that will perform the remote pings must be configured with an SNMP write community string whose source address access-list includes the address of the OpenNMS Horizon server and whose MIB view (if any) includes the OID of the ciscoPingTable.

- The corresponding SNMP write community string must be specified in the write-community attribute of either the top-level <snmp-config> element of snmp-config.xml or a <definition> child element that applies to the SNMP-primary interface of the IOS device(s) that will perform the remote pings.

Scalability concerns

This monitor spends a fair amount of time sleeping while it waits for the remote IOS device to complete the requested ping operations. The monitor is pessimistic in calculating the delay between creation of the ciscoPingTable entry and its first attempt to retrieve the results of that entry’s ping operations—it will always wait at least \((\text{packet-count} \times (\text{packet-timeout} + \text{packet-delay}))\) milliseconds before even checking whether the remote pings have completed. It’s therefore prone to hogging poller threads if used with large values for the packet-count, packet-timeout, and/or packet-delay parameters. Keep these values as small as practical to avoid tying up poller threads unnecessarily.

This monitor always uses the current time in whole seconds since the UNIX epoch as the instance identifier of the ciscoPingTable entries that it creates. The object that holds this identifier is a signed 32-bit integer type, precluding a finer resolution. It’s probably a good idea to mix in the least-significant byte of the millisecond-accurate time as a substitute for that of the whole-second-
accurate value to avoid collisions. *IOS* seems to clean up entries in this table within a manner of minutes after their ping operations have completed.

<td>This value will be substituted with the IP address of the interface on which the monitored service appears.</td>
</tr>
</tbody>
</table>

Example: Ping the same non-routable address from all routers of customer Foo

A service provider’s client, Foo Corporation, has network service at multiple locations. At each Foo location, a point-of-sale system is statically configured at IPv4 address 192.168.255.1. Foo wants to be notified any time a point-of-sale system becomes unreachable. Using an OpenNMS Horizon remote location monitor is not feasible. All of Foo Corporation’s CPE routers must be Cisco IOS devices in order to achieve full coverage in this scenario.

One approach to this requirement is to configure all of Foo Corporation’s premise routers to be in the surveillance categories Customer_Foo, CPE, and Routers, and to use a filter to create a poller package that applies only to those routers. We will use the special value `${ipaddr}` for the `proxy-ip-addr` parameter so that the remote pings will be provisioned on each Foo CPE router. Since we want each Foo CPE router to ping the same IP address 192.168.255.1, we statically list that value for the `target-ip-addr` address.

```xml
<package name="ciscoping-foo-pos">
  <filter>catincCustomer_Foo & catincCPE & catincRouters & nodeSysOID LIKE '.1.3.6.1.4.1.9.%'</filter>
  <include-range begin="0.0.0.0" end="254.254.254.254" />
  <rrd step="300">
    <rra>RRA:AVERAGE:0.5:1:2016</rra>
    <rra>RRA:AVERAGE:0.5:12:1488</rra>
    <rra>RRA:AVERAGE:0.5:288:366</rra>
    <rra>RRA:MAX:0.5:288:366</rra>
    <rra>RRA:MIN:0.5:288:366</rra>
  </rrd>
  <service name="FooPOS" interval="300000" user-defined="false" status="on">
    <parameter key="rrd-repository" value="/opt/opennms/share/rrd/response" />
    <parameter key="rrd-base-name" value="ciscoping" />
    <parameter key="ds-name" value="ciscoping" />
    <parameter key="proxy-ip-addr" value="${ipaddr}" />
    <parameter key="target-ip-addr" value="192.168.255.1" />
  </service>
  <downtime interval="30000" begin="0" end="30000" />
  <downtime interval="300000" begin="300000" end="43200000" />
  <downtime interval="600000" begin="43200000" end="43200000" />
  <downtime begin="43200000" delete="true" />
</package>
```

<monitor service="FooPOS" class-name="org.opennms.netmgt.poller.monitors.CiscoPingMibMonitor" />
Example: Ping from a single IOS device routable address of each router of customer Bar

A service provider’s client, Bar Limited, has network service at multiple locations. While OpenNMS Horizon’ world-class service assurance is generally sufficient, Bar also wants to be notified any time a premise router at one of their locations unreachable from the perspective of an IOS device in Bar’s main data center. Some or all of the Bar Limited CPE routers may be non-Cisco devices in this scenario.

To meet this requirement, our approach is to configure Bar Limited’s premise routers to be in the surveillance categories Customer_Bar, CPE, and Routers, and to use a filter to create a poller package that applies only to those routers. This time, though, we will use the special value ${ipaddr}$ not in the proxy-ip-addr parameter but in the target-ip-addr parameter so that the remote pings will be performed for each Bar CPE router. Since we want the same IOS device 20.11.5.11 to ping the CPE routers, we statically list that value for the proxy-ip-addr address. Example poller-configuration.xml additions

```xml
<package name="ciscoping-bar-cpe">
  <filter>catincCustomer_Bar & catincCPE & catincRouters</filter>
  <include-range begin="0.0.0.0" end="254.254.254.254" />
  <rrd step="300">
    <rra>RRA:AVERAGE:0.5:1:2016</rra>
    <rra>RRA:AVERAGE:0.5:12:1488</rra>
    <rra>RRA:AVERAGE:0.5:288:366</rra>
    <rra>RRA:MAX:0.5:288:366</rra>
    <rra>RRA:MIN:0.5:288:366</rra>
  </rrd>
  <service name="BarCentral" interval="300000" user-defined="false" status="on">
    <parameter key="rrd-repository" value="/opt/opennms/share/rrd/response" />
    <parameter key="rrd-base-name" value="ciscoping" />
    <parameter key="ds-name" value="ciscoping" />
    <parameter key="proxy-ip-addr" value="20.11.5.11" />
    <parameter key="target-ip-addr" value="${ipaddr}" />
  </service>
  <downtime interval="30000" begin="0" end="300000" />
  <downtime interval="300000" begin="300000" end="43200000" />
  <downtime interval="600000" begin="43200000" end="432000000" />
  <downtime begin="432000000" delete="true" />
</package>

<monitor service="BarCentral" class-name="org.opennms.netmgt.poller.monitors.CiscoPingMibMonitor" />

5.6.9. CitrixMonitor

This monitor is used to test if a Citrix® Server or XenApp Server® is providing the Independent Computing Architecture (ICA) protocol on TCP 1494. The monitor opens a TCP socket and tests the greeting banner returns with ICA, otherwise the service is unavailable.
Monitor facts

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>TCP port where the ICA protocol is listening.</td>
<td>optional</td>
<td>1494</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

If you have configure the Metaframe Presentation Server Client using Session Reliability, the TCP port is 2598 instead of 1494. You can find additional information on CTX104147. It is not verified if the monitor works in this case.

Examples

The following example configures OpenNMS Horizon to monitor the ICA protocol on TCP 1494 with 2 retries and waiting 5 seconds for each retry.

```
<service name="Citrix-TCP-ICA" interval="300000" user-defined="false" status="on">
    <parameter key="retry" value="2" />
    <parameter key="timeout" value="5000" />
</service>

<monitor service="Citrix-TCP-ICA" class-name="org.opennms.netmgt.poller.monitors.CitrixMonitor" />
```

5.6.10. DhcpMonitor

This monitor is used to check the availability and functionality of DHCP servers. The monitor class DhcpMonitor is executed by Pollerd and opens the background process listening for incoming DHCP responses. A DHCP server is tested by sending a DISCOVER message. If the DHCP server responds with an OFFER the service is marked as up. The background listening process is only started if the DhcpMonitor is used. The behavior for testing the DHCP server can be modified in the poller-configuration.xml configuration file.

Make sure no DHCP client is running on the OpenNMS Horizon server and using port UDP/67 and UDP/68. If UDP/67 and UDP/68 are already in use, you will find warning messages in your log files. You can test if a process is listening on UDP/68 with sudo ss -lnpu sport = :68.
Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.DhcpMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>true</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

**DhcpMonitor configuration**

**Table 21. DhcpMonitor parameters in poller-configuration.xml.**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>

<td>This is the name as reference for this particular data source in the RRD file</td>
<td>required</td>
<td>dhcp</td>
</tr>
</tbody>
</table>
Figure 28. Visualization of DHCP message flow in broadcast mode

Figure 29. Visualization of DHCP message flow in relay mode

Example testing DHCP server in the same subnet

Example configuration how to configure the monitor in the poller-configuration.xml. The monitor will try to send in maximum 3 DISCOVER messages and waits 3 seconds for the DHCP server OFFER message.

Configure a DHCP service in poller-configuration.xml

```xml
<service name="DHCP" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="2" />
  <parameter key="timeout" value="3000" />
  <parameter key="relayMode" value="false" />
  <parameter key="extendedMode" value="false" />
  <parameter key="rrd-repository" value="/opt/opennms/share/rrd/response" />
  <parameter key="rrd-base-name" value="dhcp" />
  <parameter key="ds-name" value="dhcp" />
</service>

<monitor service="DHCP" class-name="org.opennms.netmgt.poller.monitors.DhcpMonitor"/>
```
Example testing DHCP server in a different subnet in extended mode

You can use the same monitor in poller-configuration.xml as in the example above.

Configure DhcpMonitor to test DHCP server in a different subnet. The OFFER from the DHCP server is sent to myIpAddress.

```xml
<service name="DHCP" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="2" />
  <parameter key="timeout" value="3000" />
  <parameter key="relayMode" value="true" />
  <parameter key="extendedMode" value="false" />
  <parameter key="myIpAddress" value="1.2.3.4" />
  <parameter key="rrd-repository" value="/opt/opennms/share/rrd/response" />
  <parameter key="rrd-base-name" value="dhcp" />
  <parameter key="ds-name" value="dhcp" />
</service>

<monitor service="DHCP" class-name="org.opennms.netmgt.poller.monitors.DhcpMonitor"/>
```

If in extendedMode, the time required to complete the poll for an unresponsive node is increased by a factor of 3. Thus it is a good idea to limit the number of retries to a small number.

### 5.6.11. DiskUsageMonitor

The DiskUsageMonitor monitor can be used to test the amount of free space available on certain storages of a node. The monitor gets information about the available free storage spaces available by inspecting the hrStorageTable of the HOST-RESOURCES-MIB. A storage's description (as found in the corresponding hrStorageDescr object) must match the criteria specified by the disk and match-type parameters to be monitored. A storage's available free space is calculated using the corresponding hrStorageSize and hrStorageUsed objects.

The hrStorageUsed doesn't account for filesystem reserved blocks (i.e. for the super-user), so DiskUsageMonitor will report the service as unavailable only when the amount of free disk space is actually lower than free minus the percentage of reserved filesystem blocks.

This monitor uses SNMP to accomplish its work. Therefore systems against which it is to be used must have an SNMP agent supporting the HOST-RESOURCES-MIB installed and configured. Most modern SNMP agents, including most distributions of the Net-SNMP agent and the SNMP service that ships with Microsoft Windows, support this MIB. Out-of-box support for HOST-RESOURCES-MIB among commercial Unix operating systems may be somewhat spotty.

### Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.DiskUsageMonitor</th>
</tr>
</thead>
</table>
Remote Enabled false, relies on SNMP configuration.

Configuration and Usage

Table 22. Monitor specific parameters for the DiskUsageMonitor

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>disk</td>
<td>A pattern that a storage’s description (hrStorageDescr) must match to be taken into account.</td>
<td>required</td>
<td>-</td>
</tr>
<tr>
<td>free</td>
<td>The minimum amount of free space that storages matching the criteria must have available. This parameter is evaluated as a percent of the storage’s reported maximum capacity.</td>
<td>optional</td>
<td>15</td>
</tr>
</tbody>
</table>
| match-type | The way how the pattern specified by the disk parameter must be compared to storages description Must be one of the following symbolic operators: 
  - endswith: The disk parameter’s value is evaluated as a string that storages’ description must end with; 
  - exact: The disk parameter’s value is evaluated as a string that storages” description must exactly match; 
  - regex: The disk parameter’s value is evaluated as a regular expression that storages’ description must match; 
  -startswith: The disk parameter’s value is evaluated as a string that storages’ description must start with. Note: Comparisons are case-sensitive | optional | exact |
| port      | Destination port where the SNMP requests shall be sent. | optional | from snmp-config.xml |
| retries   | Deprecated. Same as retry. Parameter retry takes precedence when both are set. | optional | from snmp-config.xml |

This monitor implements the Common Configuration Parameters.

Examples

```xml
<!-- Make sure there's at least 5% of free space available on storages ending with "/home" -->
<service name="DiskUsage-home" interval="300000" user-defined="false" status="on">
  <parameter key="timeout" value="3000" />
  <parameter key="retry" value="2" />
  <parameter key="disk" value="/home" />
  <parameter key="match-type" value="endsWith" />
  <parameter key="free" value="5" />
</service>
<monitor service="DiskUsage-home" class-name= "org.opennms.netmgt.poller.monitors.DiskUsageMonitor" />
```
DiskUsageMonitor vs thresholds

Storages' available free space can also be monitored using thresholds if you are already collecting these data.

5.6.12. DnsMonitor

This monitor is build to test the availability of the DNS service on remote IP interfaces. The monitor tests the service availability by sending a DNS query for A resource record types against the DNS server to test.

The monitor is marked as up if the DNS Server is able to send a valid response to the monitor. For multiple records it is possible to test if the number of responses are within a given boundary.

The monitor can be simulated with the command line tool host:

```
~ % host -v -t a www.google.com 8.8.8.8
Trying "www.google.com"
Using domain server:

This monitor implements the Common Configuration Parameters.

Examples

The given examples shows how to monitor if the IP interface from a given DNS server resolves a DNS request. This service should be bound to a DNS server which should be able to give a valid DNS response for DNS request www.google.com. The service is up if the DNS server gives between 1 and 10 A record responses.

Example configuration monitoring DNS request for a given server for www.google.com

```xml
<service name="DNS-www.google.com" interval="300000" user-defined="false" status="on">
  <parameter key="lookup" value="www.google.com" />
  <parameter key="fatal-response-code" value="2" />
  <parameter key="min-answers" value="1" />
  <parameter key="max-answers" value="10" />
</service>

<monitor service="DNS-www.google.com" class-name= "org.opennms.netmgt.poller.monitors.DnsMonitor" />
```
5.6.13. DNSResolutionMonitor

The DNS resolution monitor, tests if the node label of an OpenNMS Horizon node can be resolved. This monitor uses the name resolver configuration from the poller configuration or from the operating system where OpenNMS Horizon is running on. It can be used to test a client behavior for a given host name. For example: Create a node with the node label www.google.com and an IP interface. Assigning the DNS resolution monitor on the IP interface will test if www.google.com can be resolved using the DNS configuration defined by the poller. The response from the A record lookup can be any address, it is not verified with the IP address on the OpenNMS Horizon IP interface where the monitor is assigned to. This monitor implements placeholder substitution in parameter values.

This monitor implements the Common Configuration Parameters.
Examples

The following example shows the possibilities monitoring IPv4 and/or IPv6 for the service configuration:

```xml
<!-- Assigned service test if the node label is resolved for an A record -->
<service name="DNS-Resolution-v4" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="2"/>
  <parameter key="timeout" value="2000"/>
  <parameter key="resolution-type" value="v4"/>
  <parameter key="rrd-repository" value="/opt/opennms/share/rrd/response"/>
  <parameter key="rrd-base-name" value="dns-res-v4"/>
  <parameter key="ds-name" value="dns-res-v4"/>
</service>

<!-- Assigned service test if www.google.com is resolved for an A record -->
<service name="DNS-Resolution-v4-lookup" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="2"/>
  <parameter key="timeout" value="2000"/>
  <parameter key="resolution-type" value="v4"/>
  <parameter key="lookup" value="www.google.com"/>
</service>

<!-- Assigned service test if the node label is resolved for an AAAA record using a specific DNS server -->
<service name="DNS-Resolution-v6" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="2"/>
  <parameter key="timeout" value="2000"/>
  <parameter key="resolution-type" value="v6"/>
  <parameter key="rrd-repository" value="/opt/opennms/share/rrd/response"/>
  <parameter key="rrd-base-name" value="dns-res-v6"/>
  <parameter key="ds-name" value="dns-res-v6"/>
  <parameter key="nameserver" value="8.8.8.8"/>
</service>

<!-- Use parameter substitution for nameserver and lookup parameter values -->
<service name="DNS-Resolution-Sub" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="2"/>
  <parameter key="timeout" value="2000"/>
  <parameter key="resolution-type" value="v6"/>
  <parameter key="rrd-repository" value="/opt/opennms/share/rrd/response"/>
  <parameter key="rrd-base-name" value="dns-res-v6"/>
  <parameter key="ds-name" value="dns-res-v6"/>
  <parameter key="nameserver" value="\{ipAddr\}"/>
  <parameter key="lookup" value="\{nodeLabel\}"/>
</service>

<!-- Assigned service test if the node label is resolved for an AAAA record AND A record -->
<service name="DNS-Resolution-v4-and-v6" interval="300000" user-defined="false">
```

93
To have response time graphs for the name resolution you have to configure RRD graphs for the

**DNSResolutionMonitor vs DnsMonitor**

The DNSResolutionMonitor is used to measure the availability and record outages of a name resolution from client perspective. The service is mainly used for websites or similar public available resources. It can be used in combination with the Page Sequence Monitor to give a hint if a website isn’t available for DNS reasons.

The DnsMonitor on the other hand is a test against a specific DNS server. In OpenNMS Horizon the DNS server is the node and the DnsMonitor will send a lookup request for a given A record to the DNS server IP address. The service goes down if the DNS server doesn’t have a valid A record in his zone database or as some other issues resolving A records.

### 5.6.14. FtpMonitor

The FtpMonitor is able to validate ftp connection dial-up processes. The monitor can test ftp server on multiple ports and specific login data.

The service using the FtpMonitor is up if the FTP server responds with return codes between 200 and 299. For special cases the service is also marked as up for 425 and 530.

This monitor implements **placeholder substitution in parameter values**.

**Monitor facts**

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.FtpMonitor</th>
</tr>
</thead>
<tbody>
<tr>

<td>optional</td>
<td>-</td>
<td>Yes</td>
</tr>
</tbody>
</table>
This monitor implements the Common Configuration Parameters.

Examples

Some example configuration how to configure the monitor in the 'poller-configuration.xml'

```xml
<service name="FTP" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="1"/>
  <parameter key="timeout" value="3000"/>
  <parameter key="port" value="21"/>
  <parameter key="userid" value=""/>
  <parameter key="password" value=""/>
</service>

<service name="FTP-With-Auth-From-Asset" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="1"/>
  <parameter key="timeout" value="3000"/>
  <parameter key="port" value="21"/>
  <parameter key="userid" value="{username}"/>
  <parameter key="password" value="{password}"/>
</service>

<service name="FTP-Customer" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="1"/>
  <parameter key="timeout" value="3000"/>
  <parameter key="port" value="21"/>
  <parameter key="userid" value="Customer"/>
  <parameter key="password" value="MySecretPassword"/>
</service>

<monitor service="FTP" class-name="org.opennms.netmgt.poller.monitors.FtpMonitor"/>
<monitor service="FTP-With-Auth-From-Asset" class-name="org.opennms.netmgt.poller.monitors.FtpMonitor"/>
<monitor service="FTP-Customer" class-name="org.opennms.netmgt.poller.monitors.FtpMonitor"/>
```

Hint

Comment from FtpMonitor source

Also want to accept the following ERROR message generated by some FTP servers following a QUIT command without a previous successful login: "530 QUIT : User not logged in. Please login with USER and PASS first."

Also want to accept the following ERROR message generated by some FTP servers following a QUIT command without a previously successful login: "425 Session is disconnected."

5.6.15. HostResourceSwRunMonitor

This monitor test the running state of one or more processes. It does this via SNMP by inspecting the hrSwRunTable of the HOST-RESOURCES-MIB. The test is done by matching a given process as hrSwRunName against the numeric value of the hrSwRunState.

This monitor uses SNMP to accomplish its work. Therefore systems against which it is to be used must have an SNMP agent installed and configured. Furthermore, the SNMP agent on the system must support the HOST-RESOURCES-MIB. Most modern SNMP agents, including most distributions of the Net-SNMP agent and the SNMP service that ships with Microsoft Windows, support this MIB. Out-of-box support for HOST-RESOURCES-MIB among commercial Unix operating systems may be somewhat spotty.

<td>.1.3.6.1.2.1.25.4.2.1.7</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

**Examples**

The following example shows how to monitor the process called `httpd` running on a server using this monitor. The configuration in `poller-configuration.xml` has to be defined as the following:

```
<service name="Process-httpd" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="3"/>
  <parameter key="timeout" value="3000"/>
  <parameter key="service-name" value="httpd"/>
  <parameter key="run-level" value="3"/>
  <parameter key="match-all" value="true"/>
</service>

<monitor service="Process-httpd" class-name="org.opennms.netmgt.poller.monitors.HostResourceSwRunMonitor"/>
```

① Name of the process on the system

② Test the state if the process is in a valid state, i.e. have a run-level no higher than notRunnable(3)

③ If the `httpd` process runs multiple times the test is done for each instance of the process.

**5.6.16. HttpMonitor**

The HTTP monitor tests the response of an HTTP server on a specific HTTP 'GET' command. During the poll, an attempt is made to connect on the specified port(s). The monitor can test web server on multiple ports. By default the test is made against port 80, 8080 and 8888. If the connection request is successful, an HTTP 'GET' command is sent to the interface. The response is parsed and a return code extracted and verified. This monitor implements placeholder substitution in parameter values.

  <parameter key="timeout" value="3000"/>
  <parameter key="port" value="80"/>
  <parameter key="host-name" value="opennms.com"/>
  <parameter key="url" value="/solutions"/>
  <parameter key="response" value="200-202,299"/>
  <parameter key="response-text" value="~.*[Cc]onsulting.*"/>
</service>

<!-- Test for instance of OpenNMS 1.2.9 running -->
<service name="OpenNMS-129" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="1"/>
  <parameter key="timeout" value="3000"/>
  <parameter key="port" value="8080"/>
  <parameter key="url" value="/opennms/event/list"/>
  <parameter key="basic-authentication" value="admin:admin"/>
  <parameter key="response" value="200"/>
</service>

<!-- Test for instance of OpenNMS 1.2.9 with parameter substitution in basic-authentication parameter -->
<service name="OpenNMS-22" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="1"/>
  <parameter key="timeout" value="3000"/>
  <parameter key="port" value="8080"/>
  <parameter key="url" value="/opennms/event/list"/>
  <parameter key="basic-authentication" value="{username}:{password}"/>
  <parameter key="response" value="200"/>
</service>

<monitor service="HTTP" class-name="org.opennms.netmgt.poller.monitors.HttpMonitor"/>
<monitor service="OpenNMSdotCom" class-name="org.opennms.netmgt.poller.monitors.HttpMonitor"/>
<monitor service="OpenNMS-129" class-name="org.opennms.netmgt.poller.monitors.HttpMonitor"/>
<monitor service="OpenNMS-22" class-name="org.opennms.netmgt.poller.monitors.HttpMonitor"/>
Testing filtering proxies with HttpMonitor

In case a filtering proxy server is set up to allow retrieval of some URLs but deny others, the HttpMonitor can be used to verify this behavior.

As an example a proxy server is running on TCP port 3128, and serves http://www.opennms.org/ but never http://www.myspace.com/. To test this behaviour, the HttpMonitor can be configured as the following:

```
<service name="HTTP-Allow-opennms.org" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="1"/>
  <parameter key="timeout" value="3000"/>
  <parameter key="port" value="3128"/>
  <parameter key="url" value="http://www.opennms.org/"/>
  <parameter key="response" value="200-399"/>
</service>

<service name="HTTP-Block-myspace.com" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="1"/>
  <parameter key="timeout" value="3000"/>
  <parameter key="port" value="3128"/>
  <parameter key="url" value="http://www.myspace.com/"/>
  <parameter key="response" value="400-599"/>
</service>

<monitor service="HTTP-Allow-opennms.org" class-name="org.opennms.netmgmt.poller.monitors.HttpMonitor"/>
<monitor service="HTTP-Block-myspace.com" class-name="org.opennms.netmgmt.poller.monitors.HttpMonitor"/>
```

5.6.17. HttpPostMonitor

If it is required to HTTP POST any arbitrary content to a remote URI, the HttpPostMonitor can be used. A use case is to HTTP POST to a SOAP endpoint. This monitor implements placeholder substitution in parameter values.

<tr>
<td>banner</td>
<td>A string that is matched against the response of the HTTP POST. If the output contains the banner, the service is determined as up. Specify a regex by starting with ~.</td>
<td>optional</td>
<td>-</td>
<td>Yes</td>
</tr>
<tr>
<td>charset</td>
<td>Set the character set for the POST.</td>
<td>optional</td>
<td>UTF-8</td>
<td>No</td>
</tr>
<tr>
<td>mimetype</td>
<td>Set the mimetype for the POST.</td>
<td>optional</td>
<td>text/xml</td>
<td>No</td>
</tr>
<tr>
<td>port</td>
<td>The port for the web server where the POST is send to.</td>
<td>optional</td>
<td>80</td>
<td>No</td>
</tr>
<tr>
<td>scheme</td>
<td>The connection scheme to use.</td>
<td>optional</td>
<td>http</td>
<td>No</td>
</tr>
<tr>
<td>usesslfilter</td>
<td>Enables or disables the SSL ceritificate validation. true - false</td>
<td>optional</td>
<td>false</td>
<td>No</td>
</tr>
<tr>
<td>uri</td>
<td>The uri to use during the POST.</td>
<td>optional</td>
<td>/</td>
<td>Yes</td>
</tr>
<tr>
<td>use-system-proxy</td>
<td>Should the system wide proxy settings be used? The system proxy settings can be configured in system properties</td>
<td>optional</td>
<td>false</td>
<td>No</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

Examples

The following example would create a POST that contains the payload *Word*. 
The resulting POST looks like this:

```
POST /MyServlet HTTP/1.1
Content-Type: text/xml; charset=utf-8
Host: <ip_addr_of_interface>:8080
Connection: Keep-Alive

World
```

5.6.18. HttpsMonitor

The HTTPS monitor tests the response of an SSL-enabled HTTP server. The HTTPS monitor is an SSL-enabled extension of the HTTP monitor with a default TCP port value of 443. All HttpMonitor parameters apply, so please refer to HttpMonitor’s documentation for more information. This monitor implements placeholder substitution in parameter values.

Monitor facts

</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>A list of TCP ports to which connection shall be tried.</td>
<td>optional</td>
<td>443</td>
</tr>
</tbody>
</table>

Examples
5.6.19. IcmpMonitor

The ICMP monitor tests for ICMP service availability by sending echo request ICMP messages. The service is considered available when the node sends back an echo reply ICMP message within the specified amount of time.

### Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.IcmpMonitor</th>

<td>64</td>
</tr>
<tr>
<td>thresholding-enabled</td>
<td>Enables ICMP thresholding.</td>
<td>optional</td>
<td>true</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

### Examples
<service name="ICMP" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="2"/>
  <parameter key="timeout" value="3000"/>
  <parameter key="rrd-repository" value="/var/lib/opennms/rrd/response"/>
  <parameter key="rrd-base-name" value="icmp"/>
  <parameter key="ds-name" value="icmp"/>
</service>

<monitor service="ICMP" class-name="org.opennms.netmgt.poller.monitors.IcmpMonitor"/>

<service name="ICMP" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="2"/>
  <parameter key="timeout" value="3000"/>
  <parameter key="dscp" value="0x1C"/> <!-- AF32: Class 3, Medium drop probability -->
  <parameter key="allow-fragmentation" value="false"/>
  <parameter key="packet-size" value="2048"/>
  <parameter key="rrd-repository" value="/var/lib/opennms/rrd/response"/>
  <parameter key="rrd-base-name" value="icmp"/>
  <parameter key="ds-name" value="icmp"/>
</service>

<monitor service="ICMP" class-name="org.opennms.netmgt.poller.monitors.IcmpMonitor"/>

Note on Remote Poller

The IcmpMonitor needs the JNA ICMP implementation to function on remote poller. Though, corner cases exist where the IcmpMonitor monitor won’t work on remote poller. Examples of such corner cases are: Windows when the remote poller isn't running has administrator, and Linux on ARM / Rasperry Pi. JNA is the default ICMP implementation used in the remote poller.

5.6.20. ImapMonitor

This monitor checks if an IMAP server is functional. The test is done by initializing a very simple IMAP conversation. The ImapMonitor establishes a TCP connection, sends a logout command and test the IMAP server responses.

The behavior can be simulated with telnet:
telnet mail.myserver.de 143
Trying 62.108.41.197...
Connected to mail.myserver.de.
Escape character is '^]'.
* OK [CAPABILITY IMAP4rev1 LITERAL+ SASL-IR LOGIN-REFERRALS ID ENABLE IDLE STARTTLS LOGINDISABLED] Dovecot ready. ①
ONMSPOLLER LOGOUT ②
* BYE Logging out ③
ONMSPOLLER OK Logout completed.
Connection closed by foreign host.

① Test IMAP server banner, it has to start * OK to be up
② Sending a ONMSPOLLER LOGOUT
③ Test server responds with, it has to start with * BYE to be up

If one of the tests in the sample above fails the service is marked down.

Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.ImapMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>false</td>
</tr>
</tbody>
</table>

Configuration and Usage

Table 31. Monitor specific parameters for the ImapMonitor

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>retry</td>
<td>Number of attempts to get a valid IMAP response</td>
<td>optional</td>
<td>0</td>
</tr>
<tr>
<td>port</td>
<td>The port of the IMAP server.</td>
<td>optional</td>
<td>143</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

Examples

Some example configuration how to configure the monitor in the poller-configuration.xml

```xml
<!-- Test IMAP service on port 143 only -->
<service name="IMAP" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="1"/>
  <parameter key="port" value="143"/>
  <parameter key="timeout" value="3000"/>
</service>

<monitor service="IMAP" class-name="org.opennms.netmgt.poller.monitors.ImapMonitor" />
```
5.6.21. ImapsMonitor

The IMAPS monitor tests the response of an SSL-enabled IMAP server. The IMAPS monitor is an SSL-enabled extension of the IMAP monitor with a default TCP port value of 993. All ImapMonitor parameters apply, so please refer to ImapMonitor's documentation for more information.

Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.ImapsMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>true</td>
</tr>
</tbody>
</table>

Configuration and Usage

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>The destination port where connections shall be attempted.</td>
<td>optional</td>
<td>993</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

Examples

<!-- IMAPS service at OpenNMS.org is on port 9993 -->
<service name="IMAPS" interval="300000" user-defined="false" status="on">
  <parameter key="port" value="9993"/>
  <parameter key="version" value="3"/>
  <parameter key="retry" value="2"/>
  <parameter key="timeout" value="3000"/>
  <parameter key="rrd-repository" value="/var/lib/opennms/rrd/response"/>
  <parameter key="rrd-base-name" value="imaps"/>
  <parameter key="ds-name" value="imaps"/>
</service>

<monitor service="IMAPS" class-name="org.opennms.netmgt.poller.monitors.ImapsMonitor"/>

5.6.22. JCifsMonitor

This monitor allows to test a file sharing service based on the CIFS/SMB protocol. This monitor implements placeholder substitution in parameter values.

⚠️ This monitor is not installed by default. You have to install opennms-plugin-protocol-cifs from your OpenNMS Horizon installation repository.

With the JCIFS monitor you have different possibilities to test the availability of the JCIFS service:
With the **JCifsMonitor** it is possible to run tests for the following use cases:

- share is available in the network
- a given file exists in the share
- a given folder exists in the share
- a given folder should contain at least one (1) file
- a given folder should contain no (0) files
- by testing on files and folders, you can use a regular expression to ignore specific file and folder names from the test

A network resource in SMB like a file or folder is addressed as a **UNC Path**.

```plaintext
\server\share\folder\file.txt
```

The Java implementation **jCIFS**, which implements the **CIFS/SMB** network protocol, uses **SMB URLs** to access the network resource. The same resource as in our example would look like this as an **SMB URL**:

```plaintext
smb://workgroup;user:password@server/share/folder/file.txt
```

The **JCifsMonitor** can **not** test:

- file contains specific content
- a specific number of files in a folder, for example folder should contain exactly / more or less than x files
- Age or modification time stamps of files or folders
- Permissions or other attributes of files or folders

**Monitor facts**

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitor.JCifsMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>false</td>
</tr>
</tbody>
</table>

**Configuration and Usage**

*Table 33. Monitor specific parameters for the JCifsMonitor*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
<th>Placeholder substitution</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>retry</code></td>
<td>Number of retries before the service is marked as <em>down</em>.</td>
<td>optional</td>
<td>0</td>
<td>No</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Required</td>
<td>Default value</td>
<td>Placeholder substitution</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------</td>
<td>---------------</td>
<td>--------------------------</td>
</tr>
<tr>
<td>domain</td>
<td>Windows domain where the user is located. You don’t have to use the domain parameter if you use local user accounts.</td>
<td>optional</td>
<td>empty String</td>
<td>Yes</td>
</tr>
<tr>
<td>username</td>
<td>Username to access the resource over a network</td>
<td>optional</td>
<td>empty String</td>
<td>Yes</td>
</tr>
<tr>
<td>password</td>
<td>Password for the user</td>
<td>optional</td>
<td>empty String</td>
<td>Yes</td>
</tr>
<tr>
<td>path</td>
<td>Path to the resource you want to test</td>
<td>required</td>
<td>empty String</td>
<td>No</td>
</tr>
<tr>
<td>mode</td>
<td>The test mode which has the following options:</td>
<td>optional</td>
<td>path_exist</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>path_exist: Service is <em>up</em> if the resource is accessible</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>path_not_exist: Service is <em>up</em> if the resource is <em>not</em> accessible</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>folder_empty: Service is <em>up</em> if the folder is empty (0 files)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>folder_not_empty: Service is <em>up</em> if the folder has at least one file</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>smbHost</td>
<td>Override the IP address of the SMB url to check shares on different file servers.</td>
<td>optional</td>
<td>empty String</td>
<td>No</td>
</tr>
<tr>
<td>folderIgnoreFiles</td>
<td>Ignore specific files in folder with regular expression.</td>
<td>optional</td>
<td>-</td>
<td>No</td>
</tr>
</tbody>
</table>

Due to limitations in the JCifs library, only global timeouts can be used reliably.

This monitor implements the Common Configuration Parameters.

It makes little sense to have retries higher than 1. It is a waste of resources during the monitoring.

Please consider, if you are accessing shares with Mac OSX you have some side effects with the hidden file '.DS_Store.' It could give you false positives in monitoring, you can use then the `folderIgnoreFiles` parameter.

**Example test existence of a file**

This example shows how to configure the `JCifsMonitor` to test if a file share is available over a network. For this example we have access to a share for error logs and we want to get an outage if we have any error log files in our folder. The share is named `log`. The service should go back to normal if the error log file is deleted and the folder is empty.
JCifsMonitor configuration to test that a shared folder is empty

```
<service name="CIFS-ErrorLog" interval="30000" user-defined="true" status="on">
    <parameter key="retry" value="1" />
    <parameter key="timeout" value="3000" />
    <parameter key="domain" value="contoso" />
    <parameter key="username" value="MonitoringUser" />
    <parameter key="password" value="MonitoringPassword" />
    <parameter key="path" value="/fileshare/log/" />
    <parameter key="mode" value="folder_empty" />
</service>
<monitor service="CIFS-ErrorLog" class-name="org.opennms.netmgt.poller.monitors.JCifsMonitor" />
```

1. Name of the SMB or Microsoft Windows Domain
2. User for accessing the share
3. Password for accessing the share
4. Path to the folder inside of the share as part of the SMB URL
5. Mode is set to `folder_empty`

5.6.23. JDBCMonitor

The `JDBCMonitor` checks that it is able to connect to a database and checks if it is able to get the database catalog from that database management system (DBMS). It is based on the JDBC technology to connect and communicate with the database. This monitor implements placeholder substitution in parameter values.

Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.JDBCMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>true</td>
</tr>
</tbody>
</table>

Configuration and Usage

Table 34. Monitor specific parameters for the JDBCMonitor

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
<th>Placeholder substitution</th>
</tr>
</thead>
<tbody>
<tr>
<td>driver</td>
<td>JDBC driver class to use</td>
<td>required</td>
<td>org.postgresql.Driver</td>
<td>No</td>
</tr>
<tr>
<td>url</td>
<td>JDBC Url to connect to.</td>
<td>required</td>
<td>jdbc:postgresql://:OPENNMS_JDBC_HOSTNAME/opennms</td>
<td>Yes</td>
</tr>
<tr>
<td>user</td>
<td>Database user</td>

<td>--------------------------</td>
</tr>
<tr>
<td>password</td>
<td>Database password</td>
<td>required</td>
<td>empty string</td>
<td>Yes</td>
</tr>
<tr>
<td>retries</td>
<td>How many retries should be</td>
<td>optional</td>
<td>0</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>performed before failing the test</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The OPENNMS_JDBC_HOSTNAME is replaced in the url parameter with the IP or resolved hostname of the interface the monitored service is assigned to.

This monitor implements the Common Configuration Parameters.

Provide the database driver

The JDBCMonitor is based on JDBC and requires a JDBC driver to communicate with any database. Due to the fact that OpenNMS Horizon itself uses a PostgreSQL database, the PostgreSQL JDBC driver is available out of the box. For all other database systems a compatible JDBC driver has to be provided to OpenNMS Horizon as a jar-file. To provide a JDBC driver place the driver-jar in the opennms/lib folder of your OpenNMS Horizon. To use the JDBCMonitor from a remote poller, the driver-jar has to be provided to the Remote Poller too. This may be tricky or impossible when using the Java Webstart Remote Poller, because of code signing requirements.

Examples

The following example checks if the PostgreSQL database used by OpenNMS Horizon is available.

```xml
<service name="OpenNMS-DBMS" interval="30000" user-defined="true" status="on">
  <parameter key="driver" value="org.postgresql.Driver"/>
  <parameter key="url" value="jdbc:postgresql://OPENNMS_JDBC_HOSTNAME:5432/opennms"/>
  <parameter key="user" value="opennms"/>
  <parameter key="password" value="opennms"/>
</service>

<monitor service="OpenNMS-DBMS" class-name= "org.opennms.netmgt.poller.monitors.JDBCMonitor"/>
```

5.6.24. JDBCStoredProcedureMonitor

The JDBCStoredProcedureMonitor checks the result of a stored procedure in a remote database. The result of the stored procedure has to be a boolean value (representing true or false). The service associated with this monitor is marked as up if the stored procedure returns true and it is marked as down in all other cases. It is based on the JDBC technology to connect and communicate with the database. This monitor implements placeholder substitution in parameter values.
Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.JDBCStoredProcedureMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>false</td>
</tr>
</tbody>
</table>

Configuration and Usage

Table 35. Monitor specific parameters for the JDBCStoredProcedureMonitor

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
<th>Placeholder substitution</th>
</tr>
</thead>
<tbody>
<tr>
<td>driver</td>
<td>JDBC driver class to use</td>
<td>required</td>
<td>org.postgresql.Driver</td>
<td>No</td>
</tr>
<tr>
<td>url</td>
<td>JDBC Url to connect to.</td>
<td>required</td>
<td>jdbc:postgresql:///OPENNMS_JDBC_HOSTNAME/opennms</td>
<td>Yes</td>
</tr>
<tr>
<td>user</td>
<td>Database user</td>
<td>required</td>
<td>postgres</td>
<td>Yes</td>
</tr>
<tr>
<td>password</td>
<td>Database password</td>
<td>required</td>
<td>empty string</td>
<td>Yes</td>
</tr>
<tr>
<td>retries</td>
<td>How many retries should be performed before failing the test</td>
<td>optional</td>
<td>0</td>
<td>No</td>
</tr>
<tr>
<td>stored-procedure</td>
<td>Name of the database stored procedure to call</td>
<td>required</td>
<td>-</td>
<td>No</td>
</tr>
<tr>
<td>schema</td>
<td>Name of the database schema in which the stored procedure is</td>
<td>optional</td>
<td>test</td>
<td>No</td>
</tr>
</tbody>
</table>

The OPENNMS_JDBC_HOSTNAME is replaced in the url parameter with the IP or resolved hostname of the interface the monitored service is assigned to.

This monitor implements the Common Configuration Parameters.

Provide the database driver

The JDBCStoredProcedureMonitor is based on JDBC and requires a JDBC driver to communicate with any database. Due to the fact that OpenNMS Horizon itself uses a PostgreSQL database, the PostgreSQL JDBC driver is available out of the box. For all other database systems a compatible JDBC driver has to be provided to OpenNMS Horizon as a jar-file. To provide a JDBC driver place the driver-jar in the opennms/lib folder of your OpenNMS Horizon. To use the JDBCStoredProcedureMonitor from a remote poller, the driver-jar has to be provided to the Remote Poller too. This may be tricky or impossible when using the Java Webstart Remote Poller, because of code signing requirements.
Examples

The following example checks a stored procedure added to the PostgreSQL database used by OpenNMS Horizon. The stored procedure returns true as long as less than 250000 events are in the events table of OpenNMS Horizon.

**Stored procedure which is used in the monitor**

```sql
CREATE OR REPLACE FUNCTION eventlimit_sp()
RETURNS boolean AS
$BODY$
DECLARE
    num_events integer;
BEGIN
    SELECT COUNT(*) into num_events from events;
    RETURN num_events > 250000;
END;$BODY$
LANGUAGE plpgsql VOLATILE NOT LEAKPROOF
COST 100;
```

```xml
<service name="OpenNMS-DB-SP-Event-Limit" interval="300000" user-defined="true"
status="on">
  <parameter key="driver" value="org.postgresql.Driver"/>
  <parameter key="url" value="jdbc:postgresql://OPENNMS_JDBC_HOSTNAME:5432/opennms"/>
  <parameter key="user" value="opennms"/>
  <parameter key="password" value="opennms"/>
  <parameter key="stored-procedure" value="eventlimit_sp"/>
  <parameter key="schema" value="public"/>
</service>

<monitor service="OpenNMS-DB-SP-Event-Limit" class-name="org.opennms.netmgt.poller.monitors.JDBCStoredProcedureMonitor"/>
```

### 5.6.25. JDBCQueryMonitor

The *JDBCQueryMonitor* runs an SQL query against a database and is able to verify the result of the query. A read-only connection is used to run the SQL query, so the data in the database is not altered. It is based on the *JDBC* technology to connect and communicate with the database. This monitor implements placeholder substitution in parameter values.

**Monitor facts**

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.JDBCQueryMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>false</td>
</tr>
</tbody>
</table>

**Configuration and Usage**

*Table 36. Monitor specific parameters for the JDBCQueryMonitor*
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
<th>Placeholders substitute</th>
</tr>
</thead>
<tbody>
<tr>
<td>driver</td>
<td>JDBC driver class to use</td>
<td>required</td>
<td>org.postgresql.Driver</td>
<td>No</td>
</tr>
<tr>
<td>url</td>
<td>JDBC URL to connect to</td>
<td>required</td>
<td>jdbc:postgresql://:OPENNMS_JDBC_HOSTNAME/opennms</td>
<td>Yes</td>
</tr>
<tr>
<td>user</td>
<td>Database user</td>
<td>required</td>
<td>postgres</td>
<td>Yes</td>
</tr>
<tr>
<td>password</td>
<td>Database password</td>
<td>required</td>
<td>empty string</td>
<td>Yes</td>

<tr>
<td>query</td>
<td>The SQL query to run</td>
<td>required</td>
<td>-</td>
<td>No</td>
</tr>
<tr>
<td>action</td>
<td>What evaluation action to perform</td>
<td>required</td>
<td>row_count</td>
<td>No</td>
</tr>
<tr>
<td>column</td>
<td>The result column to evaluate against when using compare_string method</td>
<td>required</td>
<td>-</td>
<td>No</td>
</tr>
<tr>
<td>operator</td>
<td>Operator to use for the evaluation</td>
<td>required</td>
<td>&gt;=</td>
<td>No</td>
</tr>
<tr>
<td>operand</td>
<td>The operand to compare against the SQL query result</td>
<td>required</td>
<td>depends on the action</td>
<td>No</td>
</tr>
<tr>
<td>message</td>
<td>The message to use if the service is down. Both operands and the operator are added to the message too.</td>
<td>optional</td>
<td>generic message depending on the action</td>
<td>No</td>
</tr>
<tr>
<td>retries</td>
<td>How many retries should be performed before failing the test</td>
<td>optional</td>
<td>0</td>
<td>No</td>
</tr>
</tbody>
</table>

The OPENNMS_JDBC_HOSTNAME is replaced in the url parameter with the IP or resolved hostname of the interface the monitored service is assigned to.

This monitor implements the [Common Configuration Parameters](#).

### Table 37. Available action parameters and their default operand

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Default operand</th>
</tr>
</thead>
<tbody>
<tr>
<td>row_count</td>
<td>The number of returned rows is compared, not a value of the resulting rows</td>
<td>1</td>
</tr>
</tbody>
</table>
### Table 38. Available operand parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Default operand</th>
</tr>
</thead>
<tbody>
<tr>
<td>compare_string</td>
<td>Strings are always checked for equality with the operand</td>
<td>-</td>
</tr>
<tr>
<td>compare_int</td>
<td>An integer from a column of the first result row is compared</td>
<td>1</td>
</tr>
</tbody>
</table>

#### Evaluating the action - operator - operand

Only the first result row returned by the SQL query is evaluated. The evaluation can be against the value of one column or the number of rows returned by the SQL query.

#### Provide the database driver

The *JDBCQueryMonitor* is based on *JDBC* and requires a JDBC driver to communicate with any database. Due to the fact that OpenNMS Horizon itself uses a PostgreSQL database, the PostgreSQL JDBC driver is available out of the box. For all other database systems a compatible JDBC driver has to be provided to OpenNMS Horizon as a *jar-file*. To provide a JDBC driver place the *driver-jar* in the *opennms/lib* folder of your OpenNMS Horizon. To use the *JDBCQueryMonitor* from a remote poller, the *driver-jar* has to be provided to the *Remote Poller* too. This may be tricky or impossible when using the *Java Webstart Remote Poller*, because of code signing requirements.

#### Examples

**Row Count**

The following example checks if the number of events in the OpenNMS Horizon database is fewer than 250,000.
<service name="OpenNMS-DB-Event-Limit" interval="30000" user-defined="true" status="on">
  <parameter key="driver" value="org.postgresql.Driver"/>
  <parameter key="url" value="jdbc:postgresql://OPENNMS_JDBC_HOSTNAME:5432/opennms"/>
  <parameter key="user" value="opennms"/>
  <parameter key="password" value="opennms"/>  
  <parameter key="query" value="select eventid from events" />
  <parameter key="action" value="row_count" />
  <parameter key="operand" value="250000" />
  <parameter key="operator" value="<" />
  <parameter key="message" value="too many events in OpenNMS database" />
</service>

<monitor service="OpenNMS-DB-Event-Limit" class-name="org.opennms.netmgt.poller.monitors.JDBCQueryMonitor"/>

String Comparison

The following example checks if the queried string matches against a defined operand.

<service name="MariaDB-Galera" interval="300000" user-defined="false" status="on">
  <parameter key="driver" value="org.mariadb.jdbc.Driver"/>
  <parameter key="user" value="opennms"/>
  <parameter key="password" value="********"/>
  <parameter key="url" value="jdbc:mysql://OPENNMS_JDBC_HOSTNAME"/>
  <parameter key="query" value="SELECT VARIABLE_VALUE FROM INFORMATION_SCHEMA.GLOBAL_STATUS WHERE VARIABLE_NAME = 'wsrep_cluster_status'"/>
  <parameter key="column" value="VARIABLE_VALUE"/>
  <parameter key="action" value="compare_string"/>
  <parameter key="operator" value="="/>
  <parameter key="operand" value="Primary"/>
  <parameter key="message" value="Galera Node is not in primary component"/>
</service>

<monitor service="MariaDB-Galera" class-name="org.opennms.netmgt.poller.monitors.JDBCQueryMonitor"/>

5.6.26. JmxMonitor

The JMX monitor allows to test service availability of Java applications. The monitor offers the following functionalities:

- test the application’s connectivity via JMX
- existence of management beans
- test the status of a single or multiple management beans and evaluate their value
Monitor facts

<table>
<thead>

</tr>
<tr>
<td>urlPath</td>
<td>Path used in JMX connection string</td>
<td>optional</td>
<td>/jmxrmi</td>
</tr>
<tr>
<td>rmiServerPort</td>
<td>RMI port</td>
<td>optional</td>
<td>45444</td>
</tr>
<tr>
<td>remoteJMX</td>
<td>Use an alternative JMX URL scheme</td>
<td>optional</td>
<td>false</td>
</tr>
<tr>
<td>beans.&lt;variable&gt;</td>
<td>Defines a mbeans objectname to access. The <code>&lt;variable&gt;</code> name is arbitrary.</td>
<td>optional</td>
<td></td>
</tr>
<tr>
<td>tests.&lt;variable&gt;</td>
<td>Tests a mbeans attribute value. The <code>&lt;variable&gt;</code> name is arbitrary.</td>
<td>optional</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**
Test if a JMX connection can be established

```xml
<service name="JMX-Connection-Test" interval="300000" user-defined="false" status="on">
    <parameter key="retry" value="3"/>
    <parameter key="timeout" value="3000"/>
    <parameter key="port" value="18980"/>
</service>
<monitor service="JMX-Connection-Test" class-name="org.opennms.netmgt.poller.monitors.JmxMonitor"/>
```

Test a specific management bean for a value

```xml
<service name="JMX-BeanValue-Test" interval="300000" user-defined="false" status="on">
    <parameter key="retry" value="3"/>
    <parameter key="timeout" value="3000"/>
    <parameter key="port" value="18980"/>
    <parameter key="beans.connected" value="org.opennms.workflow:name=client.onms.connected"/>
    <parameter key="tests.isConnected" value="connected.get("Value") == true"/>
</service>
<monitor service="JMX-BeanValue-Test" class-name="org.opennms.netmgt.poller.monitors.Jsr160Monitor"/>
```

Reserved XML characters like >, <, " need to be escaped.

5.6.27. JolokiaBeanMonitor

The JolokiaBeanMonitor is a JMX monitor specialized for the use with the Jolokia framework. If it is required to execute a method via JMX or poll an attribute via JMX, the JolokiaBeanMonitor can be used. It requires a fully installed and configured Jolokia agent to be deployed in the JVM container. If required it allows attribute names, paths, and method parameters to be provided as additional arguments to the call. To determine the status of the service the JolokiaBeanMonitor relies on the output to be matched against a banner. If the banner is part of the output the status is interpreted as up. If the banner is not available in the output the status is determined as down. Banner matching supports regular expression and substring match. This monitor implements placeholder substitution in parameter values.

Monitor facts

<td>The password to use for HTTP BASIC auth.</td>
<td>optional</td>
<td>-</td>
<td>Yes</td>
</tr>
<tr>
<td>banner</td>
<td>A string that is match against the output of the system-call. If the output contains the banner, the service is determined as up. Specify a regex by starting with ~.</td>
<td>optional</td>
<td>-</td>
<td>Yes</td>
</tr>
<tr>
<td>input1</td>
<td>Method input</td>
<td>optional</td>
<td>-</td>
<td>Yes</td>
</tr>
<tr>
<td>input2</td>
<td>Method input</td>
<td>optional</td>
<td>-</td>
<td>Yes</td>
</tr>
<tr>
<td>methodname</td>
<td>The name of the bean method to execute, output will be compared to banner.</td>
<td>optional</td>
<td>-</td>
<td>Yes</td>
</tr>
<tr>
<td>port</td>
<td>The port of the jolokia agent.</td>
<td>optional</td>
<td>8080</td>
<td>No</td>
</tr>
<tr>
<td>url</td>
<td>The jolokia agent url. Defaults to &quot;http://&lt;ipaddr&gt;:&lt;port&gt;/jolokia&quot;</td>
<td>optional</td>
<td>-</td>
<td>Yes</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

Table 41. Variables which can be used in the configuration

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>${ipaddr}</code></td>
<td>IP-address of the interface the service is bound to.</td>
</tr>
<tr>
<td><code>${port}</code></td>
<td>Port the service it bound to.</td>
</tr>
</tbody>
</table>

**Examples**

Some example configuration how to configure the monitor in the `poller-configuration.xml`
AttrName vs MethodName

The JolokiaBeanMonitor has two modes of operation. It can either scrape an attribute from a bean, or execute a method and compare output to a banner. The method execute is useful when your application has its own test methods that you would like to trigger via OpenNMS Horizon.

The args to execute a test method called "superTest" that take in a string as input would look like this:

```xml
<parameter key="beannme" value="MyBean" />
<parameter key="methodname" value="superTest" />
<parameter key="input1" value="someString"/>
```

The args to scrape an attribute from the same bean would look like this:

```xml
<parameter key="beannme" value="MyBean" />
<parameter key="attrname" value="upTime" />
```

5.6.28. LdapMonitor

The LDAP monitor tests for LDAP service availability. The LDAP monitor first tries to establish a TCP connection on the specified port. Then, if it succeeds, it will attempt to establish an LDAP connection and do a simple search. If the search returns a result within the specified timeout and attempts, the service will be considered available. The scope of the LDAP search is limited to the immediate subordinates of the base object. The LDAP search is anonymous by default. The LDAP monitor makes use of the `com.novell.ldap.LDAPConnection` class. This monitor implements placeholder substitution in parameter values.

Monitor facts

<td>No</td>
</tr>
<tr>
<td>version</td>
<td>The version of the LDAP protocol to use, specified as an integer. Note: Only LDAPv3 is supported at the moment.</td>
<td>optional</td>
<td>3</td>
<td>No</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

Examples

```xml
<!-- OpenNMS.org -->
<service name="LDAP" interval="300000" user-defined="false" status="on">
   <parameter key="port" value="389"/>
   <parameter key="version" value="3"/>
   <parameter key="searchbase" value="dc=opennms,dc=org"/>
   <parameter key="searchfilter" value="uid=ulf"/>
   <parameter key="retry" value="2"/>
   <parameter key="timeout" value="3000"/>
   <parameter key="rrd-repository" value="/var/lib/opennms/rrd/response"/>
   <parameter key="rrd-base-name" value="ldap"/>
   <parameter key="ds-name" value="ldap"/>
</service>
<monitor service="LDAP" class-name="org.opennms.netmgt.poller.monitors.LdapMonitor"/>
```

5.6.29. LdapsMonitor

The LDAPS monitor tests the response of an SSL-enabled LDAP server. The LDAPS monitor is an SSL-enabled extension of the LDAP monitor with a default TCP port value of 636. All LdapMonitor parameters apply, so please refer to LdapMonitor’s documentation for more information. This monitor implements the same placeholder substitution in parameter values as LdapMonitor.

Monitor facts

| Class Name                          | org.opennms.netmgt.poller.monitors.LdapsMonitor |
Remote Enabled: true

Configuration and Usage

Table 43. Monitor specific parameters for the LdapsMonitor

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>The destination port where connections shall be attempted.</td>
<td>optional</td>
<td>636</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

Examples

```xml
<!-- LDAPS service at OpenNMS.org is on port 6636 -->
<service name="LDAPS" interval="300000" user-defined="false" status="on">
  <parameter key="port" value="6636"/>
  <parameter key="version" value="3"/>
  <parameter key="searchbase" value="dc=opennms,dc=org"/>
  <parameter key="searchfilter" value="uid=ulf"/>
  <parameter key="retry" value="2"/>
  <parameter key="timeout" value="3000"/>
  <parameter key="rrd-repository" value="/var/lib/opennms/rrd/response"/>
  <parameter key="rrd-base-name" value="ldaps"/>
  <parameter key="ds-name" value="ldaps"/>
</service>

<monitor service="LDAPS" class-name="org.opennms.netmgt.poller.monitors.LdapsMonitor"/>
```

5.6.30. MemcachedMonitor

This monitor allows to monitor Memcached, a distributed memory object caching system. To monitor the service availability the monitor tests if the Memcached statistics can be requested. The statistics are processed and stored in RRD files. The following metrics are collected:

Table 44. Collected metrics using the MemcachedMonitor

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uptime</td>
<td>Seconds the Memcached server has been running since last restart.</td>

<td>optional</td>
<td>0</td>
</tr>
<tr>
<td>port</td>
<td>TCP port connecting to Memcached.</td>
<td>optional</td>
<td>11211</td>
</tr>
</tbody>
</table>

This monitor implements the [Common Configuration Parameters](#).

**Examples**

The following example shows a configuration in the `poller-configuration.xml`. 
5.6.31. **NetScalerGroupHealthMonitor**

This monitor is designed for *Citrix® NetScaler®* loadbalancing checks. It checks if more than x percent of the servers assigned to a specific group on a loadbalanced service are active. The required data is gathered via SNMP from the *NetScaler®*. The status of the servers is determined by the *NetScaler®*. The provided service itself is not part of the check. The basis of this monitor is the `SnmpMonitorStrategy`. A valid SNMP configuration in *OpenNMS Horizon* for the *NetScaler®* is required.

A *NetScaler®* can manage several groups of servers per application. This monitor just covers one group at a time. If there are multiple groups to check, define one monitor per group.

This monitor is not checking the loadbalanced service itself.

**Monitor facts**

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.NetScalerGroupHealthMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>false</td>
</tr>
</tbody>
</table>

**Configuration and Usage**

*Table 46. Monitor specific parameters for the NetScalerGroupHealthMonitor*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>group-name</code></td>
<td>The name of the server group to check</td>
<td>required</td>
<td>-</td>
</tr>
<tr>
<td><code>group-health</code></td>
<td>The percentage of active servers vs total server</td>
<td>optional</td>
<td>60</td>
</tr>
</tbody>
</table>

This monitor implements the [Common Configuration Parameters](#).
Examples

The following example checks a server group called central_webfront_http. If at least 70% of the servers are active, the service is up. If less than 70% of the servers are active the service is down. A configuration like the following can be used for the example in the poller-configuration.xml.

```
<service name="NetScaler_Health" interval="300000" user-defined="false" status="on">
  <parameter key="group-name" value="central_webfront_http" />
  <parameter key="group-health" value="70" />
</service>

<monitor service="NetScaler_Health" class-name="org.opennms.netmgt.poller.monitors.NetScalerGroupHealthMonitor" />
```

Details about the used SNMP checks

The monitor checks the status of the server group based on the NS-ROOT-MIB using the svcGrpMemberState. svcGrpMemberState is part of the serviceGroupMemberTable. The serviceGroupMemberTable is indexed by svcGrpMemberGroupName and svcGrpMemberName. A initial lookup for the group-name is performed. Based on the lookup the serviceGroupMemberTable is walked with the numeric representation of the server group. The monitor interprets just the server status code 7-up as active server. Other status codes like 2-unknown or 3-busy are counted for total amount of servers.

5.6.32. NrpeMonitor

This monitor allows to test plugins and checks running on the Nagios Remote Plugin Executor (NRPE) framework. The monitor allows to test the status output of any available check command executed by NRPE. Between OpenNMS Horizon and Nagios are some conceptional differences. In OpenNMS Horizon a service can only be available or not available and the response time for the service is measured. Nagios on the other hand combines service availability, performance data collection and thresholding in one check command. For this reason a Nagios check command can have more states then OK and CRITICAL. Using the NrpeMonitor marks all check command results other than OK as down. The full output of the check command output message is passed into the service down event in OpenNMS Horizon.

- NRPE configuration on the server is required and the check command has to be configured, e.g. `command[check_apt]=/usr/lib/nagios/plugins/check_apt`

- OpenNMS Horizon executes every NRPE check in a Java thread without `fork()` a process and it is more resource friendly. Nevertheless it is possible to run NRPE plugins which combine a lot of external programs like `sed`, `awk` or `cut`. Be aware, each command end up in forking additional processes.

Monitor facts

| Class Name | org.opennms.netmgt.poller.monitors.NrpeMonitor |
Remote Enabled: false

### Configuration and Usage

**Table 47. Monitor specific parameters for the NrpeMonitor**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>retry</td>
<td>Number of retries before the service is marked as <em>down</em>.</td>
<td>optional</td>
<td>0</td>
</tr>
<tr>
<td>command</td>
<td>The {check_name} of the command configured as <code>command[{check_name}]=/path/to/plugin/check-script</code></td>
<td>required</td>
<td>empty</td>
</tr>
<tr>
<td>port</td>
<td>Port to access NRPE on the remote server.</td>
<td>optional</td>
<td>5666</td>
</tr>
<tr>
<td>padding</td>
<td>Padding for sending the command to the NRPE agent.</td>
<td>optional</td>
<td>2</td>
</tr>
<tr>
<td>usesssl</td>
<td>Enable encryption of network communication. NRPE uses SSL with anonymous DH and the following cipher suite <code>TLS_DH_anon_WITH_AES_128_CBC_SHA</code></td>
<td>optional</td>
<td>true</td>
</tr>
</tbody>
</table>

This monitor implements the [Common Configuration Parameters](#).

**Example: Using `check_apt` with NRPE**

This examples shows how to configure the NrpeMonitor running the `check_apt` command on a configured NRPE.

**Configuration of the NRPE check command on the agent in `nrpe.cfg`**

```
command[check_apt]=/usr/lib/nagios/plugins/check_apt
```

**Configuration to test the NRPE plugin with the NrpeMonitor**

```
<service name="NRPE-Check-APT" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="3" />
  <parameter key="timeout" value="3000" />
  <parameter key="port" value="5666" />
  <parameter key="command" value="check_apt" />
  <parameter key="padding" value="2" />
</service>

<monitor service="NRPE-Check-APT" class-name="org.opennms.netmgt.poller.monitors.NrpeMonitor" />
```
5.6.33. NtpMonitor

The NTP monitor tests for NTP service availability. During the poll an NTP request query packet is generated. If a response is received, it is parsed and validated. If the response is a valid NTP response, the service is considered available.

Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.NtpMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>true</td>
</tr>
</tbody>
</table>

Configuration and Usage

Table 48. Monitor specific parameters for the NtpMonitor

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>The destination port where the NTP request shall be sent.</td>
<td>optional</td>
<td>123</td>
</tr>
<tr>
<td>retry</td>
<td>Number of attempts to get a response.</td>
<td>optional</td>
<td>0</td>
</tr>
<tr>
<td>timeout</td>
<td>Time in milliseconds to wait for a response.</td>
<td>optional</td>
<td>5000</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

Examples

```xml
<!-- Fast NTP server -->
<service name="NTP" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="2"/>
  <parameter key="timeout" value="1000"/>
  <parameter key="rrd-repository" value="/var/lib/opennms/rrd/response"/>
  <parameter key="rrd-base-name" value="ntp"/>
  <parameter key="ds-name" value="ntp"/>
</service>
<monitor service="NTP" class-name="org.opennms.netmgt.poller.monitors.NtpMonitor"/>
```

5.6.34. OmsaStorageMonitor

With OmsaStorageMonitor you are able to monitor your Dell OpenManaged servers RAID array status. The following OIDs from the STORAGEMANAGEMENT-MIB are supported by this monitor:

```
virtualDiskRollUpStatus .1.3.6.1.4.1.674.10893.1.20.140.1.1.19
arrayDiskLogicalConnectionVirtualDiskNumber .1.3.6.1.4.1.674.10893.1.20.140.3.1.5
arrayDiskNexusID .1.3.6.1.4.1.674.10893.1.20.130.4.1.26
arrayDiskLogicalConnectionArrayDiskNumber .1.3.6.1.4.1.674.10893.1.20.140.3.1.3
arrayDiskState .1.3.6.1.4.1.674.10893.1.20.130.4.1.4
```
To test the status of the disk array the \texttt{virtualDiskRollUpStatus} is used. If the result of the \texttt{virtualDiskRollUpStatus} is not 3 the monitors is marked as \textit{down}.

\textbf{Table 49. Possible result of virtual disk rollup status}

<table>
<thead>
<tr>
<th>Result</th>
<th>State description</th>
<th>Monitor state in OpenNMS Horizon</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>other</td>
<td>DOWN</td>
</tr>
<tr>
<td>2</td>
<td>unknown</td>
<td>DOWN</td>
</tr>
<tr>
<td>3</td>
<td>ok</td>
<td>UP</td>
</tr>
<tr>
<td>4</td>
<td>non-critical</td>
<td>DOWN</td>
</tr>
<tr>
<td>5</td>
<td>critical</td>
<td>DOWN</td>
</tr>
<tr>
<td>6</td>
<td>non-recoverable</td>
<td>DOWN</td>
</tr>
</tbody>
</table>

You'll need to know the maximum number of possible logical disks you have in your environment. For example: If you have 3 RAID arrays, you need for each logical disk array a service poller.

To give more detailed information in case of a disk array error, the monitor tries to identify the problem using the other \textit{OIDs}. This values are used to enrich the error reason in the service down event. The disk array state is resolved to a human readable value by the following status table.

\textbf{Table 50. Possible array disk state errors}

<table>
<thead>
<tr>

<td>The disk index of your RAID array</td>
<td>optional</td>
<td>1</td>
</tr>
<tr>
<td>port</td>
<td>The TCP port OpenManage is listening</td>
<td>optional</td>
<td>from snmp-config.xml</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

Examples

Some example configuration how to configure the monitor in the poller-configuration.xml. The RAID array monitor for your first array is configured with virtualDiskNumber = 1 and can look like this:

```xml
<service name="OMSA-Disk-Array-1" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="3"/>
  <parameter key="timeout" value="60000"/>
  <parameter key="virtualDiskNumber" value="1"/>
</service>

<monitor service="OMSA-Disk-Array-1" class-name="org.opennms.netmg.poller.monitors.OmsaStorageMonitor"/>
```

If there is more than one RAID array to monitor you need an additional configuration. In this case virtualDiskNumber = 2.
5.6.35. OpenManageChassisMonitor

The OpenManageChassis monitor tests the status of a Dell chassis by querying its SNMP agent. The monitor polls the value of the node’s SNMP OID .1.3.6.1.4.1.674.10892.1.300.10.1.4.1 (MIB-Dell-10892::chassisStatus). If the value is OK (3), the service is considered available.

As this monitor uses SNMP, the queried nodes must have proper SNMP configuration in snmp-config.xml.

<tr>
<td>port</td>
<td>The port to which connection shall be tried.</td>
<td>optional</td>
<td>from snmp-config.xml</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

Examples

```xml
<service name="OMA-Chassis" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="3"/>
  <parameter key="timeout" value="5000"/>
</service>

<monitor service="OMA-Chassis" class-name="org.opennms.netmgt.poller.monitors.OpenManageChassisMonitor"/>
```
Dell MIBs

Dell MIBs can be found here. Download the DCMIB<version>.zip or DCMIB<version>.exe file corresponding to the version of your OpenManage agents. The latest one should be good enough for all previous version though.

5.6.36. PageSequenceMonitor

The PageSequenceMonitor (PSM) allows OpenNMS to monitor web applications. This monitor has several configuration options regarding IPv4, IPv6 and how to deal with name resolution. To add flexibility, the node label and IP address can be passed as variable into the monitor. This allows running the monitor with node dependent configuration. Beyond testing a web application with a single URL it can also test a path through a web application. A test path through an web application can look like this:

1. login to a certain web application
2. Execute an action while being logged in
3. Log off

The service is considered as up if all this is working ok. If there’s an error somewhere, your application will need attention and the service changes the state to down.

Monitor facts

<table>

<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.PageSequenceMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>true</td>
</tr>
</tbody>
</table>

Configuration and Usage

The configuration for this monitor consists of several parts. First is the overall configuration for retries and timeouts. These parameters are global for the whole path through the web application.
Figure 30. Configuration overview of the PSM

The overall layout of the monitor configuration is more complex. Additionally, it is possible to configure a page sequence containing a path through a web application.

Table 53. Monitor parameters for the PageSequenceMonitor

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>retry</td>
<td>The number of retries per page.</td>

<td>-</td>
</tr>
<tr>
<td>disable-ssl-verification</td>
<td>Enable or disable SSL certificate verification for HTTPS tests. Please use this option carefully, for self-signed certificates import the CA certificate in the JVM and don’t just disable it.</td>
<td>optional</td>
<td>false</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Required</td>
<td>Default</td>
</tr>
<tr>
<td>--------------</td>
<td>------------------------------------------------------------------------------</td>
<td>----------</td>
<td>---------</td>
</tr>
<tr>
<td>port</td>
<td>Port of the web server connecting to</td>
<td>optional</td>
<td>80</td>
</tr>
<tr>
<td>query</td>
<td>??</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>failureMatch</td>
<td>Text to look for in the response body. This is a <em>Regular Expression</em> matched against every line, and it will be considered a failure at the first match and sets the service with this monitor <em>Down.</em></td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>failureMessage</td>
<td>The failure message is used to construct the reason code. ${n} values may be used to pull information from matching groups in the <em>failureMatch</em> regular expression.</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>successMatch</td>
<td>Text to look for in the response body. This is a <em>Regular Expression</em> matched against every line, and it will be considered a success at the first match and sets the service with this monitor <em>Up.</em></td>
<td>optional</td>
<td>-</td>
</tr>
<tr>
<td>locationMatch</td>
<td>The relative URL which must be loaded for the request to be considered successful.</td>
<td>optional</td>
<td>-</td>
</tr>
<tr>
<td>response-range</td>
<td>Range for allowed HTTP error codes from the response.</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>session-variable</td>
<td>Assign the value of a regex match group to a session variable with a user-defined name. The match group is identified by number and must be zero or greater.</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>response-range</td>
<td>A comma-separated list of acceptable <em>HTTP</em> response code ranges <em>(200–202, 299).</em></td>
<td>optional</td>
<td>100–399</td>
</tr>
</tbody>
</table>

If you set `requireIPv4` and `requireIPv6` false, the host IP for connection will be resolved from system name resolver and the associated IP address from the IP interface is ignored.

**Table 55. Variables which can be passed in the configuration**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>${nodelabel}</td>
<td>Nodelabel of the node the monitor is associated to.</td>
</tr>
</tbody>
</table>
Session variables

It is possible to assign strings from a retrieved page to variables that can be used in page parameters later in the same sequence. First, specify one or more capturing groups in the successMatch expression (see Java Class Pattern for more information on regular expressions in Java). The captured values can then be assigned to variable names by using the session-variable parameter, and used in a later page load.

Per-page response times

It is possible to collect response times for individual pages in a sequence. To use this functionality, a ds-name attribute must be added to each page whose load time should be tracked. The response time for each page will be stored in the same RRD file specified for the service via the rrd-base-name parameter under the specified datasource name.

Examples

The following example shows how to monitor the OpenNMS web application using several mechanisms. It first does an HTTP GET of ${ipaddr}/opennms (following redirects as a browser would) and then checks to ensure that the resulting page has the phrase Password on it. Next, a login is attempted using HTTP POST to the relative URL for submitting form data (usually, the URL which the form action points to). The parameters (j_username and j_password) indicate the form’s data and values to be submitted. Furthermore a custom header (foo) is set for demonstration purposes. After getting the resulting page, first the expression specified in the page’s failureMatch attribute is verified, which when found anywhere on the page indicates that the page has failed. If the failureMatch expression is not found in the resulting page, then the expression specified in the page’s successMatch attribute is checked to ensure it matches the resulting page. If the successMatch expression is not found on the page, then the page fails. If the monitor was able to successfully login, then the next page is processed. In the example, the monitor navigates to the Event page, to ensure that the text Event Queries is found on the page. Finally, the monitor calls the URL of the logout page to close the session. By using the locationMatch parameter, it is verified that the logout was successful and a redirect was triggered.

Each page is checked to ensure its HTTP response code fits into the response-range, before the failureMatch, successMatch, and locationMatch expressions are evaluated.
Configuration to test the login to the OpenNMS Web application

```
<service name="OpenNMS-Web-Login" interval="30000" user-defined="true" status="on">
  <parameter key="retry" value="1"/>
  <parameter key="timeout" value="5000"/>
  <parameter key="rrd-repository" value="/opt/opennms/share/rrd/response"/>
  <parameter key="ds-name" value="opennmslogin"/>
  <parameter key="page-sequence">
    <page path="/opennms/login.jsp"
         port="8980"
         successMatch="Password"/>
    <page path="/opennms/j_spring_security_check"
          port="8980"
          successMatch="Password"/>
    <page path="/opennms/j_spring_security_check"
          port="8980"
          method="POST">
      <parameter key="j_username" value="admin"/>
      <parameter key="j_password" value="admin"/>
      <header name="foo" value="bar"/>
    </page>
  </page-sequence>
</service>

<monitor service="OpenNMS-Web-Login" class-name="org.opennms.netmgt.poller.monitors.PageSequenceMonitor"/>
```
Test with mixing HTTP and HTTPS in a page sequence

```xml
<service name="OpenNMS-Web-Login" interval="30000" user-defined="true" status="on">
  <parameter key="retry" value="1"/>
  <parameter key="timeout" value="5000"/>
  <parameter key="rrd-repository" value="/opt/opennms/share/rrd/response"/>
  <parameter key="ds-name" value="opennmslogin"/>
  <page-sequence>
    <page scheme="http"
         host="ecomm.example.com"
         port="80"
         path="/ecomm/jsp/Login.jsp"
         virtual-host="ecomm.example.com"
         successMatch="eComm Login"
         timeout="10000"
         http-version="1.1"/>
    <page scheme="https"
          method="POST"
          host="ecomm.example.com" port="443"
          path="/ecomm/controller"
          virtual-host="ecomm.example.com"
          successMatch="requesttab_select.gif"
          failureMessage="Login failed: ${1}"
          timeout="10000"
          http-version="1.1"/>
    <parameter key="action_name" value="XbtnLogin"/>
    <parameter key="session_timeout" value=""/>
    <parameter key="userid" value="EXAMPLE"/>
    <parameter key="password" value="econ"/>
  </page>
  <page scheme="http"
        host="ecomm.example.com" port="80"
        path="/econsult/controller"
        virtual-host="ecomm.example.com"
        successMatch="You have successfully logged out of eComm"
        timeout="10000" http-version="1.1"/>
    <parameter key="action_name" value="XbtnLogout"/>
  </page>
</page-sequence>
</service>

<monitor service="OpenNMS-Web-Login" class-name="org.opennms.netmgt.poller.monitors.PageSequenceMonitor"/>
```
Test login with dynamic credentials using session variables

```
<service name="OpenNMS-Web-Login" interval="30000" user-defined="true" status="on">
  <parameter key="retry" value="1"/>
  <parameter key="timeout" value="5000"/>
  <parameter key="rrd-repository" value="/opt/opennms/share/rrd/response"/>
  <parameter key="ds-name" value="opennmslogin"/>
  <parameter key="page-sequence">
    <page-sequence name="opennms-login-seq-dynamic-credentials">
      <page path="/opennms" port="80" virtual-host="demo.opennms.org">
        successMatch="(?s)User:<.*?<strong>([^<\])*</strong>.*?Password:.*?\s?<strong>([^<\])*</strong>" />
        <session-variable name="username" match-group="1" />
        <session-variable name="password" match-group="2" />
      </page>
      <page path="/opennms/j_acegi_security_check" port="80" virtual-host="demo.opennms.org" method="POST">
        failureMatch="(?s)Your log-in attempt failed.*Reason: ([^<\])*" 
        failureMessage="Login Failed: ${1}" 
        successMatch="Log out">
        <parameter key="j_username" value="${username}" />
        <parameter key="j_password" value="${password}" />
      </page>
      <page path="/opennms/event/index.jsp" port="80" virtual-host="demo.opennms.org">
        successMatch="Event Queries" />
      <page path="/opennms/j_acegi_logout" port="80" virtual-host="demo.opennms.org"/>
      successMatch="logged off" />
    </page-sequence>
  </parameter>
</service>
```

<monitor service="OpenNMS-Web-Login" class-name="org.opennms.netmg.poller.monitors.PageSequenceMonitor"/>
Log in to demo.opennms.org without knowing username and password

```xml
<service name="OpenNMS-Demo-Login" interval="300000" user-defined="true" status="on">
  <parameter key="page-sequence">
    <page path="/opennms">
      <port>80</port>
      <virtual-host>demo.opennms.org</virtual-host>
      <successMatch>(?s)User:.<strong>(.*?)</strong>.*?Password:.<strong>(.*?)</strong>.*?</successMatch>
    </page>
    <session-variable name="username" match-group="1" />
    <session-variable name="password" match-group="2" />
  </page-sequence>
  <page path="/opennms/j_acegi_security_check">
    <port>80</port>
    <virtual-host>demo.opennms.org</virtual-host>
    <method>POST</method>
    <successMatch>Log out</successMatch>
    <parameter key="j_username" value="${username}" />
    <parameter key="j_password" value="${password}" />
  </page>
  <page path="/opennms/j_acegi_logout">
    <port>80</port>
    <virtual-host>demo.opennms.org</virtual-host>
    <successMatch>logged off</successMatch>
  </page>
</parameter>
</service>

<monitor service="OpenNMS-Demo-Login" class-name="org.opennms.netmgmt.poller.monitors.PageSequenceMonitor"/>
```
Example with per-page response times

```
<service name="OpenNMS-Login" interval="300000" user-defined="false" status="on">
  <parameter key="rrd-repository" value="/opt/opennms/share/rrd/response/>
  <parameter key="rrd-base-name" value="opennmslogin"/>
  <parameter key="ds-name" value="overall"/>
  <parameter key="page-sequence">
    <page path="/opennms/acegilogin.jsp" port="8980" ds-name="login-page"/>
    <page path="/opennms/event/index.jsp" port="8980" ds-name="event-page"/>
  </page-sequence>
</service>

<monitor service="OpenNMS-Login" class-name="org.opennms.netmgt.poller.monitors.PageSequenceMonitor"/>
```

### 5.6.37. PercMonitor

This monitor tests the status of a **PERC RAID** array.

The monitor first polls the `RAID-Adapter-MIB::logicaldriveTable` (1.3.6.1.4.1.3582.1.1.2) to retrieve the status of the **RAID** array you want to monitor. If the value of the status object of the corresponding `logicaldriveEntry` is not 2, the array is degraded and the monitor further polls the `RAID-Adapter-MIB::physicaldriveTable` (1.3.6.1.4.1.3582.1.1.3) to detect the failed drive(s).

⚠️ This monitor requires the outdated persnmpd software to be installed on the polled nodes. Please prefer using **OmsaStorageMonitor** monitor where possible.

**Monitor facts**

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.PercMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>false (relies on SNMP configuration)</td>
</tr>
</tbody>
</table>

**Configuration and Usage**

**Table 56. Monitor specific parameters for the PercMonitor**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>The RAID array you want to monitor.</td>
<td>optional</td>
<td>0.0</td>
</tr>
<tr>
<td>port</td>
<td>The UDP port to connect to</td>
<td>optional</td>
<td>from snmp-config.xml</td>
</tr>
</tbody>
</table>
This monitor implements the Common Configuration Parameters.

Examples

```xml
<!-- Monitor 1st RAID arrays using configuration from snmp-config.xml -->
<service name="PERC" interval="300000" user-defined="false" status="on" />
<monitor service="PERC" class-name="org.opennms.netmgt.poller.monitor monitors.PercMonitor" />
```

5.6.38. Pop3Monitor

The POP3 monitor tests for POP3 service availability on a node. The monitor first tries to establish a TCP connection on the specified port. If a connection is established, a service banner should have been received. The monitor makes sure the service banner is a valid POP3 banner (ie: starts with +OK). If the banner is valid, the monitor sends a QUIT POP3 command and makes sure the service answers with a valid response (ie: a response that starts with +OK). The service is considered available if the service's answer to the QUIT command is valid.

The behaviour can be simulated with telnet:

```
$ telnet mail.opennms.org 110
Trying 192.168.0.100
Connected to mail.opennms.org.
Escape character is '^]'.
+OK <21860.1076718099@mail.opennms.org>
quit
+OK
Connection closed by foreign host.
```

Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.Pop3Monitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>true</td>
</tr>
</tbody>
</table>

Configuration and Usage

</tr>
</thead>
<tbody>
<tr>
<td>strict-timeout</td>
<td>If set to true, makes sure that at least timeout milliseconds are elapsed between attempts.</td>
<td>optional</td>
<td>false</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

### Examples

```xml
<service name="POP3" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="2"/>
  <parameter key="timeout" value="3000"/>
  <parameter key="rrd-repository" value="/var/lib/opennms/rrd/response"/>
  <parameter key="rrd-base-name" value="pop3"/>
  <parameter key="ds-name" value="pop3"/>
</service>
<monitor service="POP3" class-name="org.opennms.netmgt.poller.monitors.Pop3Monitor"/>
```

### 5.6.39. PrTableMonitor

The PrTableMonitor monitor tests the prTable of a Net-SNMP agent.

**prTable definition**

A table containing information on running programs/daemons configured for monitoring in the snmpd.conf file of the agent. Processes violating the number of running processes required by the agent's configuration file are flagged with numerical and textual errors.

— UCD-SNMP-MIB

The monitor looks up the prErrorFlag entries of this table. If the value of a prErrorFlag entry in this table is set to “1” the service is considered unavailable.

**prErrorFlag definition**

An Error flag to indicate trouble with a process. It goes to 1 if there is an error, 0 if no error.

— UCD-SNMP-MIB

### Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.PrTableMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>false</td>
</tr>
</tbody>
</table>
Configuration and Usage

</tr>
<tr>
<td>retries</td>
<td><strong>Deprecated.</strong> Same as retry. Parameter retry takes precedence if both are set.</td>
<td>optional</td>
<td>from snmp-config.xml</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

Examples

```xml
<!-- Overriding default SNMP config -->
<service name="Process-Table" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="3"/>
  <parameter key="timeout" value="5000"/>
</service>

<monitor service="Process-Table" class-name="org.opennms.netmgt.poller.monitors.PrTableMonitor" />
```

UCD-SNMP-MIB

The UCD-SNMP-MIB may be found here.

5.6.40. RadiusAuthMonitor

This monitor allows to test the functionality of the RADIUS authentication system. The availability is tested by sending an AUTH packet to the RADIUS server. If a valid ACCEPT response is received, the RADIUS service is up and considered as available. This monitor implements placeholder substitution in parameter values.

⚠️ To use this monitor it is required to install the RADIUS protocol for OpenNMS Horizon.

For RPM-based distributions:

```
yum install opennms-plugin-protocol-radius
```

For Debian-based distributions:

```
apt-get install opennms-plugin-protocol-radius
```
The test is similar to test the behavior of a RADIUS server by evaluating the result with the command line tool radtest.

root@vagrant:~# radtest "John Doe" hello 127.0.0.1 1812 radiuspassword
Sending Access-Request of id 49 to 127.0.0.1 port 1812
    User-Name = "John Doe"
    User-Password = "hello"
    NAS-IP-Address = 127.0.0.1
    NAS-Port = 1812
    Message-Authenticator = 0x00000000000000000000000000000000
rad_recv: Access-Accept packet from host 127.0.0.1 port 1812, id=49, length=37
    Reply-Message = "Hello, John Doe"

① The **Access-Accept** message which is evaluated by the monitor.

This monitor implements the Common Configuration Parameters.

Examples

Example configuration how to configure the monitor in the poller-configuration.xml.

```xml
<service name="Radius-Authentication" interval="300000" user-defined="false" status="on">
   <parameter key="retry" value="3" />
   <parameter key="timeout" value="3000" />
   <parameter key="user" value="John Doe" />
   <parameter key="password" value="hello" />
   <parameter key="secret" value="radiuspassword" />
   <parameter key="rrd-repository" value="/var/lib/opennms/rrd/response" />
   <parameter key="ds-name" value="radiusauth" />
</service>

<monitor service="Radius-Authentication" class-name="org.opennms.protocols.radius.monitor.RadiusAuthMonitor" />
```

5.6.41. SmbMonitor

This monitor is used to test the NetBIOS over TCP/IP name resolution in Microsoft Windows environments. The monitor tries to retrieve a NetBIOS name for the IP address of the interface. Name services for NetBIOS in Microsoft Windows are provided on port 137/UDP or 137/TCP.

The service uses the IP address of the interface, where the monitor is assigned to. The service is up if for the given IP address a NetBIOS name is registered and can be resolved.

For troubleshooting see the usage of the Microsoft Windows command line tool nbtstat or on Linux nmblookup.

Microsoft deprecated the usage of NetBIOS. Since Windows Server 2000 DNS is used as the default name resolution.

</tbody>
</table>

This monitor implements the Common Configuration Parameters.

Examples

Some example configuration how to configure the monitor in the poller-configuration.xml.

```xml
<service name="SMB" interval="300000" user-defined="false" status="on">
    <parameter key="retry" value="1"/>
    <parameter key="timeout" value="3000"/>
</service>

<monitor service="SMB" class-name="org.opennms.netmgt.poller.monitors.SmbMonitor"/>
```

5.6.42. SmtpMonitor

The SMTP monitor tests for SMTP service availability on a node. The monitor first tries to establish a TCP connection on the specified port. If a connection is established, a service banner should have been received. The monitor makes sure the service banner is a valid SMTP banner (starts with "220"). If the banner is valid, the monitor sends a HELO SMTP command, identifying itself with the hostname of the OpenNMS server, and makes sure the service answers with a valid response (starts with "250"). If the response to the HELO is valid, the monitor issues a QUIT SMTP command. The service is considered available if the service's answer to the HELO command is valid (starts with "221").

The behaviour can be simulated with telnet or netcat:

  <parameter key="ds-name" value="smtp" />
</service>
<monitor service="SMTP" class-name="org.opennms.netmgt.poller.monitors.SmtpMonitor" />
```

5.6.43. SnmpMonitor

The SNMP monitor gives a generic possibility to monitor states and results from SNMP agents. This monitor has two basic operation modes:

- Test the response value of one specific OID (scalar object identifier);
Test multiple values in a whole table.

To decide which mode should be used, the `walk` and `match-all` parameters are used.

See the Operating mode selection' and Monitor specific parameters for the SnmpMonitor" tables below for more information about these operation modes.

**Table 62. Operating mode selection**

<table>
<thead>
<tr>
<th>walk</th>
<th>match-all</th>
<th>Operating mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>true</td>
<td>tabular, all values must match</td>
</tr>
<tr>
<td>false</td>
<td></td>
<td>tabular, any value must match</td>
</tr>
<tr>
<td>count</td>
<td></td>
<td>specifies that the value of at least minimum and at most maximum objects encountered in</td>
</tr>
<tr>
<td>false</td>
<td>true</td>
<td>scalar</td>
</tr>
<tr>
<td>false</td>
<td>false</td>
<td>scalar</td>
</tr>
<tr>
<td>count</td>
<td></td>
<td>tabular, between minimum and maximum values must match</td>
</tr>
</tbody>
</table>

This monitor can't be used on the OpenNMS Horizon Remote Poller. It is currently not possible for the Remote Poller to have access to the SNMP configuration of a central OpenNMS Horizon.

**Monitor facts**

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.SnmpMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>false</td>
</tr>
</tbody>
</table>

When the monitor is configured to persist the response time, it will count the total amount of time spent until a successful response is obtained, including the retries. It won't store the time spent during the last successful attempt.

**Configuration and Usage**

**Table 63. Monitor specific parameters for the SnmpMonitor**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
| **match-all** | Can be set to:  
  - **count**: specifies that the value of at least minimum and at most maximum objects encountered in the walk must match the criteria specified by **operand** and **operator**.  
  - **true** and **walk** is set to **true**: specifies that the value of **every** object encountered in the walk must match the criteria specified by the **operand** and **operator** parameters.  
  - **false** and **walk** is set to **true**: specifies that the value of **any** object encountered in the walk must match the criteria specified by the **operand** and **operator** parameters. | optional | true |
<p>| <strong>maximum</strong> | Valid only when <strong>match-all</strong> is set to <strong>count</strong>, otherwise ignored. Should be used in conjunction with the <strong>minimum</strong> parameter. Specifies that the value of <strong>at most</strong> maximum objects encountered in the walk must meet the criteria specified by the <strong>operand</strong> and <strong>operator</strong> parameters. | optional | 0 |
| <strong>minimum</strong> | Valid only when <strong>match-all</strong> is set to <strong>count</strong>, otherwise ignored. Should be used in conjunction with the <strong>maximum</strong> parameter. Specifies that the value of <strong>at least</strong> minimum objects encountered in the walk must meet the criteria specified by the <strong>operand</strong> and <strong>operator</strong> parameters. | optional | 0 |
| <strong>oid</strong> | The object identifier of the <strong>MIB</strong> object to monitor. If no other parameters are present, the monitor asserts that the agent's response for this object must include a valid value (as opposed to an error, no-such-name, or end-of-view condition) that is non-null. | optional | .1.3.6.1.2.1.1.2.0 (SNMPv2-MIB::SysObjectID) |
| <strong>operand</strong> | The value to be compared against the observed value of the monitored object. Note: Comparison will always succeed if either the <strong>operand</strong> or <strong>operator</strong> parameter isn't set and the monitored value is non-null. | optional | - |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>operator</td>
<td>The operator to be used for comparing the monitored object against the operand parameter. Must be one of the following symbolic operators: &lt; (&lt;): Less than. Both operand and observed object value must be numeric. &gt; (&gt;): Greater than. Both operand and observed object value must be numeric. &lt;= (⇐): Less than or equal to. Both operand and observed object value must be numeric. &gt;= (&gt;=): Greater than or equal to. Both operand and observed object value must be numeric. =: Equal to. Applied in numeric context if both operand and observed object value are numeric, otherwise in string context as a case-sensitive exact match. !=: Not equal to. Applied in numeric context if both operand and observed object value are numeric, otherwise in string context as a case-sensitive exact match. ~: Regular expression match. Always applied in string context. Note: Comparison will always succeed if either the operand or operator parameter isn’t set and the monitored value is non-null. Keep in mind that you need to escape all &lt; and &gt; characters as XML entities (&lt; and &gt; respectively)</td>
<td>optional</td>
<td>-</td>
</tr>
<tr>
<td>port</td>
<td>Destination port where the SNMP requests shall be sent.</td>
<td>optional</td>
<td>from snmp-config.xml</td>
</tr>
<tr>
<td>reason-template</td>
<td>A user-provided template used for the monitor’s reason code if the service is unavailable. Defaults to a reasonable value if unset. See below for an explanation of the possible template parameters.</td>
<td>optional</td>
<td>depends on operation mode</td>
</tr>
<tr>
<td>retries</td>
<td><strong>Deprecated</strong> Same as retry. Parameter retry takes precedence if both are set.</td>
<td>optional</td>
<td>from snmp-config.xml</td>
</tr>
<tr>
<td>walk</td>
<td><strong>false</strong>: Sets the monitor to poll for a scalar object unless if the match-all parameter is set to count, in which case the match-all parameter takes precedence. <strong>true</strong>: Sets the monitor to poll for a tabular object where the match-all parameter defines how the tabular object's values must match the criteria defined by the operator and operand parameters. See also the match-all, minimum, and maximum parameters.</td>
<td>optional</td>
<td>false</td>
</tr>
</tbody>
</table>
This monitor implements the Common Configuration Parameters.

### Table 64. Variables which can be used in the reason-template parameter

<table>
<thead>
<tr>
<th>Variable</th>

<td>Value of the <code>walk</code> parameter.</td>
</tr>
</tbody>
</table>

### Example for monitoring scalar object

As a working example we want to monitor the thermal system fan status which is provided as a scalar object ID.

```plaintext
cpqHeThermalSystemFanStatus .1.3.6.1.4.1.232.6.2.6.4.0
```

The manufacturer *MIB* gives the following information:
Description of the cpqHeThermalSystemFanStatus from CPQHLTH-MIB

SYNTAX INTEGER {
  other    (1),
  ok       (2),
  degraded (3),
  failed   (4)
}
ACCESS  read-only
DESCRIPTION
"The status of the fan(s) in the system. This value will be one of the following:
other(1)
Fan status detection is not supported by this system or driver.
ok(2)
All fans are operating properly.
degraded(3)
A non-required fan is not operating properly.
failed(4)
A required fan is not operating properly.

If the cpqHeThermalDegradedAction is set to shutdown(3) the system will be shutdown if the failed(4) condition occurs."

The SnmpMonitor is configured to test if the fan status returns ok(2). If so, the service is marked as up. Any other value indicates a problem with the thermal fan status and marks the service down.

Example SnmpMonitor as HP InsightManager fan monitor in poller-configuration.xml

```xml
<service name="HP-Insight-Fan-System" interval="300000" user-defined="false" status="on">
  <parameter key="oid" value=".1.3.6.1.4.1.232.6.2.6.4.0"/>
  <parameter key="operator" value="="/>
  <parameter key="operand" value="2"/>
  <parameter key="reason-template" value="System fan status is not ok. The state should be ok(${operand}) the observed value is ${observedValue}. Please check your HP Insight Manager. Syntax: other(1), ok(2), degraded(3), failed(4)"/>
</service>

<monitor service="HP-Insight-Fan-System" class-name="org.opennms.netmgt.poller.monitors.SnmpMonitor"/>
```

① Scalar object ID to test
② Operator for testing the response value
③ Integer 2 as operand for the test
 Encode MIB status in the reason code to give more detailed information if the service goes down.

**Example test SNMP table with all matching values**

The second mode shows how to monitor values of a whole SNMP table. As a practical use case the status of a set of physical drives is monitored. This example configuration shows the status monitoring from the CPQIDA-MIB.

We use as a scalar object id the physical drive status given by the following tabular OID:

```
cpqDaPhyDrvStatus .1.3.6.1.4.1.232.3.2.5.1.1.6
```

**Description of the cpqDaPhyDrvStatus object id from CPQIDA-MIB**

```SYNTAX  INTEGER  {
  other             (1),
  ok                (2),
  failed            (3),
  predictiveFailure (4)
}
ACCESS  read-only
DESCRIPTION
Physical Drive Status.
This shows the status of the physical drive.
The following values are valid for the physical drive status:

other (1)
  Indicates that the instrument agent does not recognize
  the drive. You may need to upgrade your instrument agent
  and/or driver software.

ok (2)
  Indicates the drive is functioning properly.

failed (3)
  Indicates that the drive is no longer operating and
  should be replaced.

predictiveFailure(4)
  Indicates that the drive has a predictive failure error and
  should be replaced.
```

The configuration in our monitor will test all physical drives for status `ok(2)`. 
Example SnmpMonitor as HP Insight physical drive monitor in poller-configuration.xml

```xml
<service name="HP-Insight-Drive-Physical" interval="300000" user-defined="false" status="on">
  <parameter key="oid" value=".1.3.6.1.4.1.232.3.2.5.1.1.6"/>
  <parameter key="walk" value="true"/>
  <parameter key="operator" value="="/>
  <parameter key="operand" value="2"/>
  <parameter key="match-all" value="true"/>
  <parameter key="reason-template" value="One or more physical drives are not ok. The state should be ok(${operand}) the observed value is ${observedValue}. Please check your HP Insight Manager. Syntax: other(1), ok(2), failed(3), predictiveFailure(4), erasing(5), eraseDone(6), eraseQueued(7)"/>
</service>

<monitor service="HP-Insight-Drive-Physical" class-name="org.opennms.netmgt.poller.monitors.SnmpMonitor" />
```

1. OID for SNMP table with all physical drive states
2. Enable walk mode to test every entry in the table against the test criteria
3. Test operator for integer
4. Integer 2 as operand for the test
5. Test in walk mode has to be passed for every entry in the table
6. Encode MIB status in the reason code to give more detailed information if the service goes down

Example test SNMP table with all matching values

This example shows how to use the SnmpMonitor to test if the number of static routes are within a given boundary. The service is marked as up if at least 3 and at maximum 10 static routes are set on a network device. This status can be monitored by polling the table ipRouteProto from the RFC1213-MIB2.

```
ipRouteProto 1.3.6.1.2.1.4.21.1.9
```

The MIB description gives us the following information:
SYNTAX INTEGER { 
  other(1),
  local(2),
  netmgmt(3),
  icmp(4),
  egp(5),
  ggp(6),
  hello(7),
  rip(8),
  is-is(9),
  es-is(10),
  ciscoIgrp(11),
  bbnSpfIgp(12),
  ospf(13),
  bgp(14)}

ACCESS read-only

DESCRIPTION
"The routing mechanism via which this route was learned. Inclusion of values for gateway routing protocols is not intended to imply that hosts should support those protocols."

To monitor only local routes, the test should be applied only on entries in the ipRouteProto table with value 2. The number of entries in the whole ipRouteProto table has to be counted and the boundaries on the number has to be applied.

Example SnmpMonitor used to test if the number of local static route entries are between 3 or 10.

```xml
<service name="All-Static-Routes" interval="300000" user-defined="false" status="on">
  <parameter key="oid" value=".1.3.6.1.2.1.4.21.1.9" />
  <parameter key="walk" value="true" />
  <parameter key="operator" value="=" />
  <parameter key="operand" value="2" />
  <parameter key="match-all" value="count" />
  <parameter key="minimum" value="3" />
  <parameter key="maximum" value="10" />
</service>

<monitor service="All-Static-Routes" class-name="org.opennms.netmgt.poller.monitors.SnmpMonitor" />
```

1. OID for SNMP table ipRouteProto
2. Enable walk mode to test every entry in the table against the test criteria
3. Test operator for integer
4. Integer 2 as operand for testing local route entries
5. Test in walk mode has is set to count to get the number of entries in the table regarding operator and operand
5.6.44. SshMonitor

The SshMonitor tests the availability of a SSH service. During the poll an attempt is made to connect on the specified port. If the connection request is successful, then the service is considered up. Optionally, the banner line generated by the service may be parsed and compared against a pattern before the service is considered up.

Monitor facts

<td>optional</td>
<td>22</td>
</tr>
<tr>
<td>retry</td>
<td>Number of attempts to establish the SSH connection.</td>
<td>optional</td>
<td>0</td>
</tr>
</tbody>
</table>

This monitor implements the [Common Configuration Parameters](#).

Examples
This monitor is used to test if a SSL certificate presented by a remote network server are valid. A certificate is invalid if its initial time is prior to the current time, or if the current time is prior to 7 days (configurable) before the expiration time.

You can simulate the behavior by running a command like this:

```
echo | openssl s_client -connect <site>:<port> 2>/dev/null | openssl x509 -noout -dates
```

The output shows you the time range a certificate is valid:

```
notBefore=Dec 24 14:11:34 2013 GMT
notAfter=Dec 25 10:37:40 2014 GMT
```

You can configure a threshold in days applied on the `notAfter` date.

While the monitor is mainly useful for plain SSL sockets, the monitor does provide limited support for STARTTLS protocols by providing the user with the ability to specify a STARTTLS message to be sent prior to the SSL negotiation and a regular expression to match to the response received from the server. An additional preliminary message and response regular expression pair is available for protocols that require it (such as XMPP).

This monitor implements placeholder substitution in parameter values.

<td>${svcname}</td>
<td>The service name</td>
</tr>
</tbody>
</table>

The monitor has limited support for communicating on other protocol layers above the SSL session layer. The STARTTLS support has only been tested with a single XMPP server. It is not known if the same approach will prove useful for other use cases, like sending a Host header for HTTPS, or issue a STARTTLS command for IMAP, POP3, SMTP, FTP, LDAP, or NNTP.

**Examples**

The following examples show how to monitor SSL certificates on services like IMAPS, SMTPS and
HTTPS as well as an example use of the STARTTLS feature for XMPP. If the certificates expire within 30 days the service goes down and indicates this issue in the reason of the monitor. In this example the monitoring interval is reduced to test the certificate every 2 hours (7,200,000 ms). Configuration in poller-configuration.xml is as the following:
<service name="SSL-Cert-IMAPS-993" interval="7200000" user-defined="false" status="on">
  <parameter key="retry" value="2"/>
  <parameter key="timeout" value="2000"/>
  <parameter key="port" value="993"/>
  <parameter key="days" value="30"/>
</service>

<service name="SSL-Cert-SMTPS-465" interval="7200000" user-defined="false" status="on">
  <parameter key="retry" value="2"/>
  <parameter key="timeout" value="2000"/>
  <parameter key="port" value="465"/>
  <parameter key="days" value="30"/>
</service>

<service name="SSL-Cert-HTTPS-443" interval="7200000" user-defined="false" status="on">
  <parameter key="retry" value="2"/>
  <parameter key="timeout" value="3000"/>
  <parameter key="port" value="443"/>
  <parameter key="days" value="30"/>
  <parameter key="server-name" value="${nodelabel}.example.com"/>
</service>

<service name="XMPP-STARTTLS-5222" interval="7200000" user-defined="false" status="on">
  <parameter key="retry" value="2"/>
  <parameter key="timeout" value="3000"/>
  <parameter key="port" value="5222"/>
  <parameter key="days" value="30"/>
  <parameter key="starttls-preamble" value="<stream:stream
xmlns:stream='http://etherx.jabber.org/streams' xmlns='jabber:client' to='{ipAddr}'
version='1.0'/>">

5.6.46. StrafePingMonitor

This monitor is used to monitor packet delay variation to a specific endpoint using ICMP. The main
use case is to monitor a WAN end point and visualize packet loss and ICMP packet round trip time deviation. The *StrafePingMonitor* performs multiple ICMP echo requests (ping) and stores the response-time of each as well as the packet loss, in a RRD file. Credit is due to Tobias Oetiker, as this graphing feature is an adaptation of the *SmokePing* tool that he developed.

![Graph of StrafePing Response Time]

**Figure 31. Visualization of a graph from the StrafePingMonitor**

**Configuration and Usage**

Monitor specific parameters for the StrafePingMonitor

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>Time in milliseconds to wait before assuming that a packet has not responded</td>
<td>option</td>
<td>800</td>
</tr>
<tr>
<td>retry</td>
<td>The number of retries to attempt when a packet fails to respond in the given timeout</td>
<td>option</td>
<td>2</td>
</tr>
<tr>
<td>ping-count</td>
<td>The number of pings to attempt each interval</td>
<td>required</td>
<td>20</td>
</tr>
<tr>
<td>failure-ping-count</td>
<td>The number of pings that need to fail for the service to be considered down</td>
<td>required</td>
<td>20</td>
</tr>
<tr>
<td>allow-fragmentation</td>
<td>Whether to set the &quot;Don't Fragment&quot; bit on outgoing packets</td>
<td>option</td>
<td>true</td>
</tr>
<tr>
<td>dscp</td>
<td>DSCP traffic-control value.</td>
<td>option</td>
<td>0</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Required</td>
<td>Default value</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------</td>
<td>------------------------</td>
</tr>
<tr>
<td>packet-size</td>
<td>Number of bytes of the ICMP packet to send.</td>
<td>optional</td>
<td>64</td>
</tr>
<tr>
<td>wait-interval</td>
<td>Time in milliseconds to wait between each ICMP echo-request packet</td>
<td>required</td>
<td>50</td>
</tr>
<tr>
<td>rrd-repository</td>
<td>The location to write RRD data. Generally, you will not want to change this from default</td>
<td>required</td>
<td>$OPENNMS_HOME/share/rrd/response</td>
</tr>
<tr>
<td>rrd-base-name</td>
<td>The name of the RRD file to write (minus the extension, .rrd or .jrb)</td>
<td>required</td>
<td>strafePing</td>
</tr>
</tbody>
</table>

This monitor implements the [Common Configuration Parameters](#).

**Examples**

The *StrafePingMonitor* is typically used on WAN connections and not activated for every ICMP enabled device in your network. Further this monitor is much I/O heavier than just a simple RRD graph with a single ICMP response time measurement. By default you can find a separate poller package in the 'poller-configuration.xml' called *strafe*. Configure the include-range or a filter to enable monitoring for devices with the service *StrafePing*.

![💡](https://i.imgur.com/123456.png) Don’t forget to assign the service *StrafePing* on the IP interface to be activated.

The following example enables the monitoring for the service *StrafePing* on IP interfaces in the range 10.0.0.1 until 10.0.0.20. Additionally the Nodes have to be in a surveillance category named Latency.
5.6.47. TcpMonitor

This monitor is used to test IP Layer 4 connectivity using TCP. The monitor establishes an TCP connection to a specific port. To test the availability of the service, the greetings banner of the application is evaluated. The behavior is similar to a simple test using the telnet command as shown in the example.

Simulating behavior of the monitor with telnet

```
root@vagrant:~# telnet 127.0.0.1 22
Trying 127.0.0.1...
Connected to 127.0.0.1.
Escape character is '^]'.
SSH-2.0-OpenSSH_6.6.1p1 Ubuntu-2ubuntu2 ①
```

① Service greeting banner

Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.TcpMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>true</td>
</tr>
</tbody>
</table>
Configuration and Usage

Table 68. Monitor specific parameters for the TcpMonitor

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>TCP port of the application.</td>
<td>required</td>
<td>-1</td>
</tr>
<tr>
<td>retry</td>
<td>Number of retries before the service is marked as <em>down</em>.</td>
<td>optional</td>
<td>0</td>
</tr>
<tr>
<td>banner</td>
<td>Evaluation of the service connection banner with regular expression.</td>
<td>optional</td>
<td>*</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

Examples

This example shows to test if the ICA service is available on TCP port 1494. The test evaluates the connection banner starting with ICA.

```
<service name="TCP-Citrix-ICA" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="0" />
  <parameter key="banner" value="ICA" />
  <parameter key="port" value="1494" />
  <parameter key="timeout" value="3000" />
  <parameter key="rrd-repository" value="/var/lib/opennms/rrd/response" />
  <parameter key="rrd-base-name" value="tcpCitrixIca" />
  <parameter key="ds-name" value="tcpCitrixIca" />
</service>

<monitor service="TCP-Citrix-ICA" class-name= "org.opennms.netmgt.poller.monitors.TcpMonitor" />
```

5.6.48. SystemExecuteMonitor

If it is required to execute a system call or run a script to determine a service status, the SystemExecuteMonitor can be used. It is calling a script or system command, if required it provides additional arguments to the call. To determine the status of the service the SystemExecuteMonitor can rely on 0 or a non-0 exit code of system call. As an alternative, the output of the system call can be matched against a banner. If the banner is part of the output the status is interpreted as up. If the banner is not available in the output the status is determined as down.

Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.SystemExecuteMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>true</td>
</tr>
</tbody>
</table>
Configuration and Usage

Table 69. Monitor specific parameters for the SystemExecuteMonitor

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>script</td>
<td>The system-call to execute.</td>
<td>required</td>
<td>-</td>
</tr>
<tr>
<td>args</td>
<td>The arguments to hand over to the system-call. It supports variable replacement, see below.</td>
<td>optional</td>
<td>-</td>
</tr>
<tr>
<td>banner</td>
<td>A string that is match against the output of the system-call. If the output contains the banner, the service is determined as <em>UP</em>.</td>
<td>optional</td>
<td>-</td>
</tr>
</tbody>
</table>

The parameter *args* supports variable replacement for the following set of variables.

![💡] Providing always a script output with a more detailed test error makes it easier to diagnose the problem when the nodeLostDown event occurs.

This monitor implements the Common Configuration Parameters.

Table 70. Variables which can be used in the configuration

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>${timeout}</td>
<td>Timeout in milliseconds, based on config of the service.</td>
</tr>
<tr>
<td>${timeoutsec}</td>
<td>Timeout in seconds, based on config of the service.</td>
</tr>
<tr>
<td>${retry}</td>
<td>Amount of retries based on config of the service.</td>
</tr>
<tr>
<td>${svcname}</td>
<td>Service name based on the config of the service.</td>
</tr>
<tr>
<td>${ipaddr}</td>
<td>IP-address of the interface the service is bound to.</td>
</tr>
<tr>
<td>${nodeid}</td>
<td>Nodeid of the node the monitor is associated to.</td>
</tr>
<tr>
<td>${nodelabel}</td>
<td>Nodelabel of the node the monitor is associated to.</td>
</tr>
</tbody>
</table>

Examples

**Placeholder usage**

```xml
<parameter key="args" value="-i ${ipaddr} -t ${timeout}"/>
<parameter key="args" value="http://${nodelabel}/${svcname}/static"/>
```

**Exit status example**
#!/usr/bin/env bash

# ...some test logic

RESULT="TEST OK"

if [[ "TEST OK" == "$RESULT" ]]; then
    echo "This test passed"
    exit 0
else
    echo "This test failed because of ..."
    exit 1
fi

Banner matching example

#!/usr/bin/env bash

# ...some test logic

RESULT="TEST OK"

if [[ "TEST OK" == "$RESULT" ]]; then
    echo "PASSED"
else
    echo "FAILED"
fi
**SystemExecuteMonitor vs GpMonitor**

The SystemExecuteMonitor is the successor of the GpMonitor. The main differences are:

- Variable replacement for the parameter args
- There are no fixed arguments handed to the system-call
- The SystemExecuteMonitor supports RemotePoller deployment

To migrate services from the GpMonitor to the SystemExecuteMonitor it is required to alter the parameter args. To match the arguments called hoption for the hostAddress and toption for the timeoutInSeconds. The args string that matches the GpMonitor call looks like this:

```xml
<parameter key="args" value="--hostname ${ipaddr} --timeout ${timeoutsec}" />
```

To migrate the GpMonitor parameters hoption and toption just replace the --hostname and --timeout directly in the args key.

**5.6.49. VmwareCimMonitor**

This monitor is part of the VMware integration provided in Provisiond. The monitor is specialized to test the health status provided from all Host System (host) sensor data.

- This monitor is only executed if the host is in power state *on*.

This monitor requires to import hosts with Provisiond and the VMware import. OpenNMS Horizon requires network access to VMware vCenter and the hosts. To get the sensor data the credentials from vmware-config.xml for the responsible vCenter is used. The following asset fields are filled from Provisiond and is provided by VMware import feature: VMware Management Server, VMware Managed Entity Type and the foreignId which contains an internal VMware vCenter Identifier.

The global health status is evaluated by testing all available host sensors and evaluating the state of each sensor. A sensor state could be represented as the following:

- **Unknown(0)**
- **OK(5)**
- **Degraded/Warning(10)**
- **Minor failure(15)**
- **Major failure(20)**
- **Critical failure(25)**
- **Non-recoverable error(30)**

The service is *up* if all sensors have the status **OK(5)**. If any sensor gives another status then **OK(5)** the service is marked as *down*. The monitor error reason contains a list of all sensors which not
In case of using Distributed Power Management the standBy state forces a service down. The health status is gathered with a direct connection to the host and in stand by this connection is unavailable and the service is down. To deal with stand by states, the configuration ignoreStandBy can be used. In case of a stand by state, the service is considered as up.

State can be changed see the ignoreStandBy configuration parameter.

### Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.VmwareCimMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>false</td>
</tr>
</tbody>
</table>

### Configuration and Usage

**Table 71. Monitor specific parameters for the VmwareCimMonitor**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>retry</td>
<td>Number of retries before the service is marked as down.</td>
<td>optional</td>
<td>0</td>
</tr>
<tr>
<td>ignoreStandBy</td>
<td>Treat power state standBy as up.</td>
<td>optional</td>
<td>false</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

### Examples

Some example configuration how to configure the monitor in the poller-configuration.xml.

```xml
<service name="VMwareCim-HostSystem" interval="300000" user-defined="false" status="on">
  <parameter key="retry" value="2"/>
  <parameter key="timeout" value="3000"/>
</service>

<monitor service="VMwareCim-HostSystem" class-name="org.opennms.netmgt.poller.monitors.VmwareCimMonitor"/>
```

### 5.6.50. VmwareMonitor

This monitor is part of the VMware integration provided in Provisiond and test the power state of a virtual machine (VM) or a host system (host). If the power state of a VM or host is poweredOn the service is up. The state off the service on the VM or Host is marked as down. By default standBy is also considered as down. In case of using Distributed Power Management the standBy state can be changed see the ignoreStandBy configuration parameter.
The information for the status of a virtual machine is collected from the responsible VMware vCenter using the credentials from the vmware-config.xml. It is also required to get specific asset fields assigned to an imported virtual machine and host system. The following asset fields are required, which are populated by the VMware integration in Provision: VMware Management Server, VMware Managed Entity Type and the foreignId which contains an internal VMware vCenter Identifier.

Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.VmwareMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>false</td>

<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>retry</td>
<td>Number of retries before the service is marked as down.</td>
<td>optional</td>
<td>0</td>
</tr>
<tr>
<td>ignoreStandBy</td>
<td>Treat power state standBy as up.</td>
<td>optional</td>
<td>false</td>
</tr>
<tr>
<td>reportAlarms</td>
<td>Checks for unacknowledged vSphere alarms for a given comma-separated list of severities (red, yellow, green, gray).</td>
<td>optional</td>
<td>``</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

Examples

Some example configuration how to configure the monitor in the poller-configuration.xml. With this configuration the monitor will go down if any unacknowledged vSphere alarms with severity red or yellow exist for this managed entity.

```
<service name="VMware-ManagedEntity" interval="300000" user-defined="false" status="on">
    <parameter key="retry" value="2"/>
    <parameter key="timeout" value="3000"/>
    <parameter key="reportAlarms" value="red, yellow"/>
</service>

<monitor service="VMware-ManagedEntity" class-name="org.opennms.netmgt.poller.monitors.VmwareMonitor"/>
```
5.6.51. WebMonitor

WebMonitor is a clone of HttpMonitor, that uses a different underlying library for doing HTTP connections. WebMonitor uses Apache HttpClient, which acts more like a real browser (follows redirects, etc.) than HttpMonitor.

Monitor facts

</table>
5.6.52. Win32ServiceMonitor

The Win32ServiceMonitor enables OpenNMS Horizon to monitor the running state of any Windows service. The service status is monitored using the Microsoft Windows® provided SNMP agent providing the LAN Manager MIB-II. For this reason it is required the SNMP agent and OpenNMS Horizon is correctly configured to allow queries against part of the MIB tree. The status of the service is monitored by polling the

\[\text{svSvcOperatingState} = 1.3.6.1.4.1.77.1.2.3.1.3\]

of a given service by the display name.

Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.Win32ServiceMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>false</td>
</tr>
</tbody>
</table>

Configuration and Usage

**Table 74. Monitor specific parameters for the Win32ServiceMonitor**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>service-name</td>
<td>The name of the service, this should be the exact name of the Windows service to monitor as it appears in the Services MSC snap-in. Short names such as you might use with net start will not work here.</td>
<td>required</td>
<td>Server</td>
</tr>
</tbody>
</table>

This monitor implements the [Common Configuration Parameters](#). Non-English Windows The `service-name` is sometime encoded in languages other than English. Like in French, the `Task Scheduler` service is `Planificateur de tâche`. Because of the “â” (non-English character), the OID value is encoded in hexa (0x50 6C 61 6E 69 66 69 63 61 74 61 6E 69 66 69 63 61 74 65 77 72 20 64 65 20 74 C3 A2 63 68 65 73).

Troubleshooting

If you've created a Win32ServiceMonitor poller and are having difficulties with it not being monitored properly on your hosts, chances are there is a difference in the name of the service you've created, and the actual name in the registry.

For example, I need to monitor a process called Example Service on one of our production servers. I retrieve the Display name from looking at the service in service manager, and create an entry in the poller-configuration.xml files using the exact name in the Display name field.

However, what I don’t see is the errant space at the end of the service display name that is revealed when doing the following:
snmpwalk -v 2c -c <communitystring> <hostname> .1.3.6.1.4.1.77.1.2.3.1.1

This provides the critical piece of information I am missing:

ISO.3.6.1.4.1.77.1.2.3.1.1.31.83.166.97.102.101.119.97.114.101.32.83.84.65.70.70.86.73.69.87.32.66.97.99.107.103.114.111.117.110.100.32 = STRING: "Example Service "

Note the extra space before the close quote.

The extra space at the end of the name was difficult to notice in the service manager GUI, but is easily visible in the snmpwalk output. The right way to fix this would be to correct the service Display name field on the server, however, the intent of this procedure is to recommend verifying the true name using snmpwalk as opposed to relying on the service manager GUI.

Examples

Monitoring the service running state of the Task Scheduler on an English local Microsoft Windows® Server requires at minimum the following entry in the poller-configuration.xml.

```xml
<service name="Windows-Task-Scheduler" interval="300000" user-defined="false" status="on">
  <parameter key="service-name" value="Task Scheduler"/>
</service>

<monitor service="Windows-Task-Scheduler" class-name="org.opennms.netmgt.poller.monitors.Win32ServiceMonitor"/>
```

5.6.53. WsManMonitor

This monitor can be used to issue a WS-Man Get command and validate the results using a SPEL expression. This monitor implements placeholder substitution in parameter values.

Monitor facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.WsManMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>false</td>
</tr>
</tbody>
</table>

Configuration and Usage

*Table 75. Monitor specific parameters for the WsManMonitor*
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
<th>Placeholder substitution</th>
</tr>
</thead>
<tbody>
<tr>
<td>resource-uri</td>
<td>Resource URI</td>
<td>required</td>
<td>-</td>
<td>No</td>
</tr>
<tr>
<td>rule</td>
<td>SPEL expression applied against the result of the <code>Get</code></td>
<td>required</td>
<td>-</td>
<td>Yes</td>
</tr>
<tr>
<td>selector.</td>
<td>Used to filter the result set. All selectors must prefixed with selector.</td>
<td>optional</td>
<td>(None)</td>
<td>No</td>
</tr>
</tbody>
</table>

This monitor implements the [Common Configuration Parameters](#).

**Examples**

The following monitor will issue a `Get` against the configured resource and verify that the correct service tag is returned:

```xml
<service name="WsMan-ServiceTag-Check" interval="300000" user-defined="false" status="on">
  <parameter key="selector.CreationClassName" value="DCIM_ComputerSystem"/>
  <parameter key="selector.Name" value="srv:system"/>
  <parameter key="rule" value="#IdentifyingDescriptions matches '.*ServiceTag' and #OtherIdentifyingInfo matches 'C7BBBP1'"/>
</service>

<monitor service="WsMan-ServiceTag-Check" class-name="org.opennms.netmgt.poller.monitors.WsManMonitor"/>
```

### 5.6.54. XmpMonitor

The [XMP](#) monitor tests for XMP service/agent availability by establishing an XMP session and querying the target agent's `sysObjectID` variable contained in the Core MIB. The service is considered available when the session attempt succeeds and the agent returns its `sysObjectID` without error.

**Monitor facts**

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.poller.monitors.XmpMonitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Enabled</td>
<td>false</td>
</tr>
</tbody>
</table>

**Configuration and Usage**

These parameters can be set in the XMP service entry in `collectd-configuration.xml` and will override settings from `xmp-config.xml`. Also, don't forget to add an entry in `response-
graph.properties so that response values will be graphed.

Table 76. Monitor specific parameters for the XmpMonitor

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>Time in milliseconds to wait for a successful session.</td>
<td>optional</td>
<td>5000</td>
</tr>
<tr>
<td>authenUser</td>
<td>The authenUser parameter for use with the XMP session.</td>
<td>optional</td>
<td>xmpUser</td>
</tr>
<tr>
<td>port</td>
<td>TCP port to connect to for XMP session establishment</td>
<td>optional</td>
<td>5270</td>
</tr>
<tr>
<td>mib</td>
<td>Name of MIB to query</td>
<td>optional</td>
<td>core</td>
</tr>
<tr>
<td>object</td>
<td>Name of MIB object to query</td>
<td>optional</td>
<td>sysObjectID</td>
</tr>
</tbody>
</table>

This monitor implements the Common Configuration Parameters.

Examples

Adding entry in collectd-configuration.xml

```xml
<service name="XMP" interval="300000" user-defined="false" status="on">
  <parameter key="timeout" value="3000"/>
  <parameter key="rrd-repository" value="/opt/opennms/share/rrd/response"/>
  <parameter key="rrd-base-name" value="xmp"/>
  <parameter key="ds-name" value="xmp"/>
</service>
<monitor service="XMP" class-name="org.opennms.netmgt.poller.monitors.XmpMonitor"/>
```

Add entry in response-graph.properties

```properties
reports=icmp, \
xmp, . . . . .
report.xmp.name=XMP
report.xmp.columns=xmp
report.xmp.type=responseTime
report.xmp.command=--title="XMP Response Time" \n  --vertical-label="Seconds"  \n  DEF:rtMills={rrd1}:xmp:AVERAGE \n  DEF:minRtMills={rrd1}:xmp:MIN \n  DEF:maxRtMills={rrd1}:xmp:MAX \n  CDEF:rt=rtMills,1000,/ \n  CDEF:minRt=minRtMills,1000,/ \n  CDEF:maxRt=maxRtMills,1000,/ \n  LINE1:rt#0000ff:"Response Time" \n  GPRINT:rt:AVERAGE:" Avg \:: %8.2lf %s" \n  GPRINT:rt:MIN:"Min \:: %8.2lf %s" \n  GPRINT:rt:MAX:"Max \:: %8.2lf %s\n"
```

176
Chapter 6. Performance Management

OpenNMS Horizon collects performance data using the Collectd daemon, which is enabled by default. Collectd schedules data collection on OpenNMS Horizon entities (currently nodes and interfaces), using management agents and protocol-specific collectors (SNMP, HTTPS, JMX, JDBC, etc.) to collect performance metrics. Each collector has its own associated configuration that defines parameters for the collector.

By default, data collection is enabled for SNMP and for OpenNMS-JVM (to monitor itself through JMX). Data collection works out of the box with SNMP, provided you have your SNMP community string configured properly. The default value of the community string is public. If your community string is different, you need to change the value:

1. Login to the web UI.
2. Go to **admin>Configure OpenNMS**.
3. In the **Provisioning** section, select **Configure SNMP Community Names by IP Address**.
4. Under **v1/v2c specific parameters** change the **Read Community String** value and click **Save Config**.

Performance data collection on other protocols (HTTPS, JMX, JDBC, etc.), requires additional configuration. You may also want to change how collectd works: when, how, and what data it collects.

Learn how to manage performance data collection:

- collectd configuration
- collection for specific protocols
- resource type management
- collectd administration (logging, graphing, and event properties)
6.1. Configuring *Collectd*

The *collectd-configuration.xml* file defines the nodes, services and parameters on which *collectd* collects metrics. It also specifies the list of available collectors.

The file is located in `$OPENNMS_HOME`.

Edit the *collectd-configuration.xml* file to:

- set the thread pool
- configure collector packages
- specify collectors to use

In addition to editing the *collectd-configuration.xml*, you need to configure collectors for the protocols from which you want to collect data by editing the configuration files associated with them.

### 6.1.1. Setting the Thread Pool

A globally defined thread attribute limits the number of threads the data collection process uses in parallel. Increase or decrease this value based on your network and the size of your server by changing the value in `$OPENNMS_HOME/etc/collectd-configuration.xml`:

```
<collectd-configuration
  threads="50">
```

### 6.1.2. Configuring Collector Packages

Collector packages in the *collectd-configuration.xml* file contain the information (IP addresses, interfaces, services, and connection parameters) that *collectd* needs to activate data collection.

*collectd* activates data collection for each node that contains an IP interface in the configured range and also contains any of the services listed in the package associated with the selected IP interface.

Edit existing collector packages or create new ones to customize data collection for your needs. If you create a new collector package, we recommend copying and pasting an existing package in the *collectd-configuration.xml* to use as a template.

A collector package has two categories of information to edit or specify:

- collector package attributes
- collector package services

**Collector Package Attributes**

At a minimum, collector package attributes include a package name and a filter that specifies the interfaces to include in the collector package:
Note that \texttt{remote="false"} means that the services in this package are tested only from the OpenNMS core system itself and not from a different remote location.

Each package must have a filter tag that performs the initial test to see if an interface should be included in a package. Filters operate on interfaces (not nodes). Each package can have only one filter tag.

The following tags are also available for an interface filter:

<table>
<thead>
<tr>
<th>Tag</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>specific</td>
<td>Specify an actual IP address to include in the package.</td>
<td>\texttt{&lt;specific&gt;192.168.1.59&lt;/specific&gt;}</td>
</tr>
<tr>
<td>include-range</td>
<td>Specify a range of IP addresses to include in a package.</td>
<td>\texttt{&lt;include-range begin=&quot;192.168.0.100&quot; end=&quot;192.168.0.104&quot;/&gt;}</td>
</tr>
<tr>
<td>exclude-range</td>
<td>Specify a range of IP addresses to exclude in a package. This will override an include-range tag.</td>
<td>\texttt{&lt;include-url&gt;file:/opt/OpenNMS/etc/include&lt;/include-url&gt;}</td>
</tr>
<tr>
<td>include-url</td>
<td>Specify a file that contains a list of IP addresses to include.</td>
<td>\texttt{&lt;include-url&gt;file:/opt/OpenNMS/etc/include&lt;/include-url&gt;}</td>
</tr>
</tbody>
</table>

The following example illustrates collector package attributes that use some of these additional tags:

\texttt{<package name="example1" remote="false">}
\texttt{<filter>IPADDR != '0.0.0.0'</filter>}
\texttt{<include-range begin="1.1.1.1" end="254.254.254.254"/>}
\texttt{<include-range begin="::1" end="ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff"/>}

\textbf{①} Unique name of the collection package.

\textbf{②} Apply this package to all IP interfaces with a configured IPv4 address (not equal 0.0.0.0)

\textbf{③} Evaluate IPv4 rule to collect for all IPv4 interfaces in the given range

\textbf{④} Evaluate IPv6 rule to collect for all IPv6 interfaces in the given range

\textit{Service Configuration Attributes}

Service configuration attributes define the collector to use and which performance metrics to collect. Each service is associated with a specific collector; the collector and its related Java class must appear at the bottom of the \texttt{collectd-configuration.xml} file:
<service name="SNMP">
  interval="300000"
  user-defined="false"
  status="on">
  <parameter key="collection" value="default"/>
  <parameter key="thresholding-enabled" value="true"/>
</service>

<collector service="SNMP" class-name="org.opennms.netmgmt.collectd.SnmpCollector"/>

① Service configuration name, which is mapped to a specific collector.
② The interval at which to collect the service (in milliseconds).
③ Marker to say if service is user defined (used for UI purposes).
④ Service is collected only if "on".
⑤ Assign the performance data collection schema named default (found in the corresponding configuration file for the type of collection, in this case datacollection-config.xml).
⑥ Enable threshold evaluation for metrics provided by this service.
⑦ Run the SnmpCollector implementation for the service named SNMP.

The following table lists service attributes common to all services. For a list of collector-specific parameters and their default values, refer to the specific collector listed in the Collectors section.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Service name</td>
</tr>
<tr>
<td>interval</td>
<td>Polling interval, in milliseconds (5 minutes by default).</td>
</tr>
<tr>
<td>user-defined</td>
<td>Set to &quot;true&quot; if user defined the collection source in the UI.</td>
</tr>
<tr>
<td>status</td>
<td>Indicates that data collection for the service is on or off.</td>
</tr>
</tbody>
</table>
6.1.3. Guidelines for Collector Packages

You can configure multiple packages, and an interface can exist in more than one package. This gives great flexibility in determining the service levels for a given device.

When IP interfaces match multiple collector packages with the same service configuration, collectd applies the last collector package on the service:

- Use this "final" collector package as a less-specific, catch-all filter for a default configuration.

OR

- Use it as a more-specific collector package to overwrite the default setting.

**Meta-Data-DSL**

**Metadata-DSL** allows you to use dynamic configuration in each parameter value to interpolate metadata into a parameter. The syntax allows for the use of patterns in an expression, whereby the metadata is replaced with a corresponding value during the collection process.

During evaluation of an expression the following scopes are available:

- Node metadata
- Interface metadata
- Service metadata
6.2. Configuring Collectors

Collectors collect performance data via specific agents and protocols. This section includes the following information for each collector:

- collector-specific parameters (used in the `collectd-configuration.xml` file)
- configuration file(s)

Understanding resource types helps when editing collector-specific configuration files.

6.2.1. SnmpCollector

The `SnmpCollector` collects performance data through the SNMP protocol. Configure access to the SNMP Agent through the SNMP configuration in the Web UI (Admin>Configure SNMP Community Names by IP Address).

Collector Facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.collectd.SnmpCollector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Package</td>
<td>core</td>
</tr>
<tr>
<td>Supported on Minion</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Collector Parameters

Use these parameters used in the `collectd-configuration.xml` file.

### Table 77. Collector-specific parameters for the SnmpCollector

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>collection</td>
<td>The name of the SNMP Collection to use.</td>
<td>required</td>
<td>default</td>
</tr>
<tr>
<td>thresholding-enabled</td>
<td>Whether collected performance data should be tested against thresholds.</td>
<td>optional</td>
<td>true</td>
</tr>
<tr>
<td>timeout</td>
<td>Timeout in milliseconds to wait for SNMP responses.</td>
<td>optional</td>
<td>SNMP configuration</td>
</tr>
</tbody>
</table>

SNMP Collection Configuration

Understanding resource types helps when editing collector-specific configuration files.

Define SNMP Collection in `etc/datacollection-config.xml` and `etc/datacollection.d/*.xml`.
<xml version="1.0"/>
<datacollection-config rrd-repository="/var/lib/opennms/rrd/snmp/">①
    <snmp-collection name="default"②
        snmpStorageFlag="select">③
        <rrd step="300">④
            <rra>RRA:AVERAGE:0.5:1:2016</rra>
            <rra>RRA:AVERAGE:0.5:12:1488</rra>
            <rra>RRA:AVERAGE:0.5:288:366</rra>
            <rra>RRA:MAX:0.5:288:366</rra>
            <rra>RRA:MIN:0.5:288:366</rra>
        </rrd>
    </snmp-collection>
    <include-collection dataCollectionGroup="MIB2"/>⑤
    <include-collection dataCollectionGroup="3Com"/>
    ...
    <include-collection dataCollectionGroup="VMware-Cim"/>
</datacollection-config>

① Directory where to persist RRD files on the file system, ignored if NewTS is used as time-series storage.
② Name of the SNMP data collection referenced in the collection package in collectd-configuration.xml.
③ Configure SNMP MIB-II interface metric collection behavior: all means collect metrics from all interfaces, primary only from interface provisioned as primary interface, select only from manually selected interfaces from the Web UI.
④ RRD archive configuration for this set of performance metrics, ignored when NewTS is used as time series storage.
⑤ Include device- or application-specific performance metric OIDS to collect.

Figure 34. Configuration overview for SNMP data collection

SnmpCollectorNG

The SnmpCollectorNG provides an alternate implementation to the SnmpCollector that takes advantages of new APIs in the platform. It is provided as a separate collector while we work to validate its functionality and run-time characteristics, with the goal of eventually having it replace the SnmpCollector.
Use this new collector by updating existing references from org.opennms.netmgt.collectd.SnmpCollector to org.opennms.netmgt.collectd.SnmpCollectorNG.

Known caveats include:

- No support for alias type resources
- No support for min/max values

### 6.2.2. JmxCollector

The JmxCollector collects performance data via JMX. Attributes are extracted from the available MBeans.

**Collector Facts**

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.collectd.Jsr160Collector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Package</td>
<td>core</td>
</tr>
<tr>
<td>Supported on Minion</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Collector Parameters**

Use these parameters in the collectd-configuration.xml file.

*Table 78. Collector-specific parameters for the Jsr160Collector*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>collection</td>
<td>The name of the JMX Collection to use.</td>
<td>required</td>
<td>(none)</td>
</tr>
<tr>
<td>thresholding-enabled</td>
<td>Whether collected performance data should be tested against thresholds</td>
<td>optional</td>
<td>true</td>
</tr>
<tr>
<td>retry</td>
<td>Number of retries</td>
<td>optional</td>
<td>3</td>
</tr>
<tr>
<td>friendlyName</td>
<td>Name of the path in which the metrics should be stored</td>
<td>optional</td>
<td>Value of the port, or 'jsr160' if no port is set.</td>
</tr>
<tr>
<td>factory</td>
<td>The password strategy to use. Supported values are: STANDARD (for authentication), PASSWORD_CLEAR (same as STANDARD) and SASL (if secure connection is required).</td>
<td>optional</td>
<td>STANDARD</td>
</tr>
<tr>
<td>url</td>
<td>The connection url, e.g., service:jmx:rmi:localhost:18980. The IP address can be substituted. Use ${ipaddr} in that case, e.g., service:jmx:rmi:${ipaddr}:18980</td>
<td>optional</td>
<td>(none)</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Required</td>
<td>Default value</td>
</tr>
<tr>
<td>-------------</td>
<td>------------------------------------------------------------------</td>
<td>----------</td>
<td>---------------</td>
</tr>
<tr>
<td>username</td>
<td>The username if authentication is required.</td>
<td>optional</td>
<td>(none)</td>
</tr>
<tr>
<td>password</td>
<td>The password if authentication is required.</td>
<td>optional</td>
<td>(none)</td>
</tr>
<tr>
<td>port</td>
<td><strong>Deprecated.</strong> JMX port.</td>
<td>optional</td>
<td>1099</td>
</tr>
<tr>
<td>protocol</td>
<td><strong>Deprecated.</strong> Protocol used in the JMX connection string.</td>
<td>optional</td>
<td>rmi</td>
</tr>
<tr>
<td>urlPath</td>
<td><strong>Deprecated.</strong> Path used in JMX connection string.</td>
<td>optional</td>
<td>/jmxrmi</td>
</tr>
<tr>
<td>rmiServerPort</td>
<td><strong>Deprecated.</strong> RMI port.</td>
<td>optional</td>
<td>45444</td>
</tr>
<tr>
<td>remoteJMX</td>
<td><strong>Deprecated.</strong> Use an alternative JMX URL scheme.</td>
<td>optional</td>
<td>false</td>
</tr>
</tbody>
</table>

The deprecated parameters `port`, `protocol`, `urlPath`, `rmiServerPort` and `remoteJMX` should be replaced with the `url` parameter. If `url` is not defined the collector falls back to legacy mode and the deprecated parameters are used instead to build the connection url.

If a service requires different configuration, an entry in `$OPENNMS_HOME/etc/jmx-datacollection-config.xml` can overwrite it.

**JMX Collection Configuration**

Understanding **resource types** helps when editing collector-specific configuration files.

Define **JMX Collections** in `etc/jmx-datacollection-config.xml` and `etc/jmx-datacollection-config.d/`.

This snippet provides a collection definition named `opennms-poller:`
Once added to etc/jmx-datacollection-config.xml you can test it using the collect command available in the Karaf Shell:

```bash
opennms:collect org.opennms.netmgmt.collectd.Jsr160Collector 127.0.0.1
collection=opennms-poller port=18980
```

**Generic Resource Type**

To support wildcard (*) in objectname, JMX collector supports generic resource types. JMX configuration requires two changes for this to work:

- Create a custom resource type in etc/resource-types.d/. For example, there is already a definition in jmx-resource.xml that defines a custom resource for Kafka lag

```xml
<resource-types>
  <resourceType name="kafkaLag" label="Kafka Lag"
    resourceLabel="${index}">
    <persistenceSelectorStrategy class="org.opennms.netmgmt.collection.support.PersistAllSelectorStrategy"/>
    <storageStrategy class="org.opennms.netmgmt.dao.support.SiblingColumnStorageStrategy">
      <parameter key="sibling-column-name" value="name" />
    </storageStrategy>
  </resourceType>
</resource-types>
```

- Match the resourceType name as resource-type in MBean definition:
Resource definition

JMX objectname is the full name of MBean in form of (domain:key=value, key=value, ..). Wildcard (*) can exist anywhere in the objectname.

Depending on wildcard definition, use SiblingColumnStorageStrategy to extract resource label. If wildcard exists in the value (usual case), use corresponding key as the sibling-column-name parameter.

For example:
org.apache.activemq:BrokerName=*,Type=Queue,Destination=com.mycompany.myqueue

Here BrokerName can be defined as parameter for SiblingColumnStorageStrategy

<parameter key="sibling-column-name" value="BrokerName" />

The extracted BrokerNames from the wildcard will be the resource folders in the form of nodeId/resourceTypeName/{resource-label}

Wildcard may exist in domain as well. For example: org.apache.*:BrokerName=trap, Type=Queue. Then domain can be defined as the sibling-column-name parameter.

<parameter key="sibling-column-name" value="domain" />

To use the objectname itself as a resource label, use IndexStorageStrategy as storageStrategy in resource-type definition.

Third-Party JMX Services

Some Java applications provide their own JMX implementation and require certain libraries to be present on the classpath, e.g., the Java application server Wildfly. To successfully collect data, you may need to do the following:

- Place the jmx client lib to the $OPENNMS_HOME/lib folder (e.g., jboss-cli-client.jar)
- Configure the collection accordingly (see above)
- Configure the JMX-Collector in collectd-configuration.xml (see below)
Example

```xml
<service name="JMX-WILDFLY" interval="300000" user-defined="false" status="on">
  <parameter key="url" value="service:jmx:http-remoting-jmx://${ipaddr}:9990"/>
  <parameter key="retry" value="2"/>
  <parameter key="timeout" value="3000"/>
  <parameter key="factory" value="PASSWORD-CLEAR"/>
  <parameter key="username" value="admin"/>
  <parameter key="password" value="admin"/>
  <parameter key="rrd-base-name" value="java"/>
  <parameter key="collection" value="jsr160"/>
  <parameter key="thresholding-enabled" value="true"/>
  <parameter key="ds-name" value="jmx-wildfly"/>
  <parameter key="friendly-name" value="jmx-wildfly"/>
</service>

<collector service="JMX-WILDFLY" class-name="org.opennms.netmgt.collectd.Jsr160Collector"/>
```

### 6.2.3. HttpCollector

The **HttpCollector** collects performance data via **HTTP** and **HTTPS**. Attributes are extracted from the **HTTP** responses using a regular expression.

#### Collector Facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.collectd.HttpCollector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Package</td>
<td>core</td>
</tr>
<tr>
<td>Supported on Minion</td>
<td>Yes</td>
</tr>
</tbody>
</table>

#### Collector Parameters

Use these parameters in the `collectd-configuration.xml` file.

**Table 79. Collector-specific parameters for the HttpCollector**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>collection</td>
<td>The name of the <strong>HTTP Collection</strong> to use.</td>
<td>required</td>
<td>(none)</td>
</tr>
<tr>
<td>thresholding-enabled</td>
<td>Whether collected performance data should be tested against thresholds.</td>
<td>optional</td>
<td>true</td>
</tr>
<tr>
<td>port</td>
<td>Override the default port in all of the URIs</td>
<td>optional</td>
<td>80</td>
</tr>
<tr>
<td>timeout</td>
<td>Connection and socket timeout in milliseconds</td>
<td>optional</td>
<td>3000</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Required</td>
<td>Default Value</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------</td>
<td>---------------</td>
</tr>
<tr>
<td>retry</td>
<td>Number of retries</td>
<td>optional</td>
<td>2</td>
</tr>
<tr>
<td>use-system-proxy</td>
<td>Should the system-wide proxy settings be used? Configure system proxy settings via system properties</td>
<td>optional</td>
<td>false</td>
</tr>
</tbody>
</table>

### HTTP Collection Configuration

Understanding [resource types](#) helps when editing collector-specific configuration files.

Define **HTTP Collections** in `etc/http-datacollection-config.xml`.

This snippet provides a collection definition named `opennms-copyright`:

```xml
<http-collection name="opennms-copyright">
  <rrd step="300">
    <rra>RRA:AVERAGE:0.5:1:2016</rra>
    <rra>RRA:AVERAGE:0.5:12:1488</rra>
    <rra>RRA:AVERAGE:0.5:288:366</rra>
    <rra>RRA:MAX:0.5:288:366</rra>
    <rra>RRA:MIN:0.5:288:366</rra>
  </rrd>
  <uris>
    <uri name="login-page">
      <url path="/opennms/login.jsp" matches=".*2002-([0-9]+).*
response-range="100-399" dotall="true"/>
    </url>
    <attributes>
      <attrib alias="copyrightYear" match-group="1" type="gauge"/>
    </attributes>
  </uri>
</http-collection>
```

Once added to `etc/http-datacollection-config.xml` you can test it using the `collect` command available in the Karaf Shell:

```
opennms:collect org.opennms.netmgt.collectd.HttpCollector 127.0.0.1
collection=opennms-copyright port=8980
```

### 6.2.4. JdbcCollector

The `JdbcCollector` collects performance data via JDBC drivers. Attributes are retrieved using SQL queries.
Collector Facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.collectd.JdbcCollector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Package</td>
<td>core</td>
</tr>
<tr>
<td>Supported on Minion</td>
<td>Yes (see limitations)</td>
</tr>
</tbody>
</table>

Limitations on Minion

When running on Minion the data sources in opennms-datasources.xml cannot be referenced. Instead, you must set the JDBC connection settings using the service parameters.

Also, the JDBC driver must be properly loaded in the Minion container (see Installing JDBC drivers in Minion) By default, only the JDBC driver for PostgreSQL is available.

Collector Parameters

Use these parameters in the collectd-configuration.xml file.

Table 80. Collector-specific parameters for the JdbcCollector

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>collection</code></td>
<td>The name of the JDBC Collection to use.</td>
<td>required</td>
<td>(empty)</td>
</tr>
<tr>
<td><code>dataSource</code></td>
<td>Use an existing datasource defined in opennms-datasources.xml</td>
<td>optional</td>
<td>NO_DATASOURCE_FOUND</td>
</tr>
<tr>
<td><code>driver</code></td>
<td>Driver class name</td>
<td>optional</td>
<td>org.postgresql.Driver</td>
</tr>
<tr>
<td><code>url</code></td>
<td>JDBC URL</td>
<td>optional</td>
<td>jdbc:postgresql://OPENNMS_JDBC_HOSTNAME/opennms</td>
</tr>
<tr>
<td><code>user</code></td>
<td>JDBC username</td>
<td>optional</td>
<td>postgres</td>
</tr>
<tr>
<td><code>password</code></td>
<td>JDBC password</td>
<td>optional</td>
<td>(empty string)</td>
</tr>
</tbody>
</table>

JDBC Collection Configuration

Understanding resource types helps when editing collector-specific configuration files.

Define JDBC Collections in etc/jdbc-datacollection-config.xml.

This snippet provided a collection definition named opennms-stats:
Once added to etc/jdbc-datacollection-config.xml you can test it using the collect command available in the Karaf Shell:

```
opennms:collect org.opennms.netmgt.collectd.JdbcCollector 127.0.0.1
collection=opennms-stats data-source=opennms
```

To test this same collection on Minion you must specify the JDBC settings as service attributes, for example:

```
opennms:collect -l MINION org.opennms.netmgt.collectd.JdbcCollector 127.0.0.1
collection=opennms-stats driver=org.postgresql.Driver
url=jdbc:postgresql://localhost:5432/opennms user=opennms password=opennms
```

### 6.2.5. NSClientCollector

The NSClientCollector collects performance data over HTTP from NSClient++.

**Collector Facts**

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.protocols.nsclient.collector.NSClientCollector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Package</td>
<td>opennms-plugin-protocol-nsclient</td>
</tr>
<tr>
<td>Supported on Minion</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Collector Parameters

Use these parameters in the `collectd-configuration.xml` file.

Table 81. Collector-specific parameters for the NSClientCollector

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>collection</td>
<td>The name of the NSClient Collection to use.</td>
<td>optional</td>
<td>default</td>
</tr>
</tbody>
</table>

6.2.6. PrometheusCollector

The PrometheusCollector collects performance metrics via HTTP(S) using the text-based Prometheus Exposition format. This has been adopted by many applications and is in the process of being standardized in the OpenMetrics project.

This collector provides tools for parsing and mapping the metrics to the collection model used by OpenNMS Horizon.

Collector Facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.collectd.prometheus.PrometheusCollector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Package</td>
<td>core</td>
</tr>
<tr>
<td>Supported on Minion</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Collector Parameters

Table 82. Collector-specific parameters for the PrometheusCollector

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>collection</td>
<td>The name of the Prometheus Collection to use</td>
<td>required</td>
<td></td>
</tr>
<tr>
<td>url</td>
<td>HTTP URL to query for the metrics</td>
<td>required</td>
<td></td>
</tr>
<tr>
<td>timeout</td>
<td>HTTP socket and read timeout in milliseconds</td>
<td>optional</td>
<td>10000 (10 seconds)</td>
</tr>
<tr>
<td>retry</td>
<td>Number of retries before failing</td>
<td>optional</td>
<td>2</td>
</tr>
<tr>
<td><code>header-*</code></td>
<td>Optional headers to pass in the HTTP request</td>
<td>optional</td>
<td>(none)</td>
</tr>
</tbody>
</table>

Prometheus Collector Usage

Let's demonstrate the usage of the collector with an example running against node_exporter.

Obtain a copy of the appropriate release binary from the node_exporter release page.

Extract and start the service:
From the Karaf Shell, you can now issue an ad hoc collection request against the `node_exporter` process:

```
admin@opennms> opennms:collect
org.opennms.netmgt.collectd.prometheus.PrometheusCollector 127.0.0.1
collection=node_exporter url='http://127.0.0.1:9100/metrics'
```

NOTE: Some collectors require a database node and IP interface.

NodeLevelResource[nodeId=0,path=null]
  Group: node_exporter_loadavg
    Attribute[load1:1.26]
    Attribute[load15:1.0]
    Attribute[load5:0.59]
  Group: node_exporter_memory
    Attribute[Active_anon_bytes:1.1776770048E10]
    Attribute[Active_bytes:2.4471535616E10]
    Attribute[Active_file_bytes:1.2694765568E10]

Update the IP addresses in the command as necessary.

**Prometheus Collector Configuration**

Prometheus collection definitions are maintained in `etc/prometheus-datacollection.d/`.

Let's look at an excerpt of the `node_exporter` collection:
This group definition matches metrics that start the `node_memory_` prefix, extracts the suffix as the metric name and associates these metrics with the `node_exporter_memory` group in the node-level resource.

Expression are written in Spring Expression Language (SpEL). The metric instances are used as the expression context, which means you have access to the name and label properties.

Here's another excerpt where we extract metrics grouped by CPU:

```<group name="node_exporter_cpus" resource-type="nodeExporterCPU" filter-exp="name matches 'node_cpu'" group-by-exp="labels[cpu]"><numeric-attribute alias-exp="labels[mode]"/></group>```

This group definition matches metrics called ‘node_cpu’, groups them by the value of the cpu label and extracts the name of the mode for the name of the numeric attributes.

### 6.2.7. TcaCollector

The TcaCollector collects special SNMP data from Juniper TCA Devices.
Collector Facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.collectd.tca.TcaCollector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Package</td>
<td>opennms-plugin-collector-juniper-tca</td>
</tr>
<tr>
<td>Supported on Minion</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Collector Parameters

Use these parameters in the `collectd-configuration.xml` file.

Table 83. Collector-specific parameters for the TcaCollector

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>collection</code></td>
<td>The name of the TCA Collection to use.</td>
<td>required</td>
<td></td>
</tr>
</tbody>
</table>

6.2.8. VmwareCimCollector

The VmwareCimCollector collects ESXi host and sensor metrics from vCenter.

Collector Facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.collectd.VmwareCimCollector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Package</td>
<td>core</td>
</tr>
<tr>
<td>Supported on Minion</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Collector Parameters

Use these parameters in the `collectd-configuration.xml` file.

Table 84. Collector-specific parameters for the VmwareCimCollector

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>collection</code></td>
<td>The name of the VMWare CIM Collection to use.</td>
<td>required</td>
<td></td>
</tr>
<tr>
<td><code>timeout</code></td>
<td>Connection timeout in milliseconds</td>
<td>optional</td>
<td></td>
</tr>
</tbody>
</table>

6.2.9. VmwareCollector

The VmwareCollector collects performance metrics for managed entities from vCenter.

Collector Facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.collectd.VmwareCollector</th>
</tr>
</thead>
</table>
Collector Parameters

Use these parameters in the `collectd-configuration.xml` file.

Table 85. Collector-specific parameters for the VmwareCollector

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>collection</code></td>
<td>The name of the VMWare Collection to use.</td>
<td>required</td>
<td></td>
</tr>
<tr>
<td><code>timeout</code></td>
<td>Connection timeout in milliseconds</td>
<td>optional</td>
<td></td>
</tr>
</tbody>
</table>

6.2.10. WmiCollector

The `WmiCollector` collects performance metrics from Windows systems using Windows Management Instrumentation (WMI).

Collector Facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.collectd.WmiCollector</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Package</th>
<th>core</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported on Minion</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Collector Parameters

Use these parameters in the `collectd-configuration.xml` file.

Table 86. Collector-specific parameters for the WmiCollector

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>collection</code></td>
<td>The name of the WMI Collection to use.</td>
<td>required</td>
<td></td>
</tr>
</tbody>
</table>

6.2.11. WsManCollector

The `WsManCollector` collects performance metrics using the Web Services-Management (WS-Management) protocol.

Web Services-Management (WS-Management) is a DMTF open standard defining a SOAP-based protocol for the management of servers, devices, applications and various Web services. Windows Remote Management (WinRM) is the Microsoft implementation of WS-Management Protocol.
Collector Facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.collectd.WsManCollector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Package</td>
<td>core</td>
</tr>
<tr>
<td>Supported on Minion</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Collector Parameters

Use these parameters in the `collectd-configuration.xml` file.

Table 87. Collector-specific parameters for the WsManCollector

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>collection</td>
<td>The name of the WS-Man Collection to use.</td>
<td>required</td>
<td></td>
</tr>
</tbody>
</table>

WS-Management Setup

Before setting up OpenNMS Horizon to communicate with a WS-Management agent, you should confirm that it is properly configured and reachable from the OpenNMS Horizon system. If you need help enabling the WS-Management agent, consult the documentation from the manufacturer. Here are some resources that could help:

- Installation and Configuration for Windows Remote Management
- Troubleshooting WinRM connection and authentication

We suggest using the Openwsman command line client to validate authentication and connectivity. Packages are available for most distributions under `wsmancli`.

For example:

```
wsman identify -h localhost -P 5985 -u wsman -p secret
```

Once validated, add the agent-specific details to the OpenNMS Horizon configuration, defined in the next section.

Troubleshooting and Commands

For troubleshooting there is a set of commands you can use in Powershell verified on Microsoft Windows Server 2012.

Enable WinRM in PowerShell

```
Enable-PSRemoting
```
Set up Firewall for WinRM over HTTP

```
netsh advfirewall firewall add rule name="WinRM-HTTP" dir=in localport=5985 protocol=TCP action=allow
```

Set up Firewall for WinRM over HTTPS

```
netsh advfirewall firewall add rule name="WinRM-HTTPS" dir=in localport=5986 protocol=TCP action=allow
```

Test WinRM on local Windows Server

```
winrm id
```

Show WinRM configuration on Windows Server

```
winrm get winrm/config
```

Show listener for configuration on Windows Server

```
winrm e winrm/config/listener
```

Test connectivity from a Linux system

```
nc -z -w1 <windows-server-ip-or-host> 5985;echo $?
```

Use BasicAuthentication just with WinRM over HTTPS with verifiable certificates in production environment.

Enable BasicAuthentication

```
winrm set winrm/config/client/auth '{Basic="true"}'
winrm set winrm/config/service/auth '{Basic="true"}'
winrm set winrm/config/service '{AllowUnencrypted="true"}'
```

WS-Management Agent Configuration

Understanding resource types helps when editing collector-specific configuration files.

The agent-specific configuration details are maintained in etc/wsman-config.xml. This file has a similar structure as etc/snmp-config.xml, which the reader may already be familiar with.

This file is consulted when a connection to a WS-Man Agent is made. If the IP address of the agent is matched by the range, specific or ip-match elements of a definition, then the attributes on that

---

198
definition are used to connect to the agent. Otherwise, the attributes on the outer `wsman-config` definition are used.

This `etc/wsman-config.xml` file automatically reloads when modified.

Here is an example with several definitions:

```xml
<?xml version="1.0"?>
<wsman-config retry="3" timeout="1500" ssl="true" strict-ssl="false" path="/wsman">
  <definition ssl="true" strict-ssl="false" path="/wsman" username="root" password="calvin" product-vendor="Dell" product-version="iDRAC 6">
    <range begin="192.168.1.1" end="192.168.1.10"/>
  </definition>
  <definition ssl="false" port="5985" path="/wsman" username="Administrator" password="P@ssword">
    <ip-match>172.23.1-4.1-255</ip-match>
    <specific>172.23.1.105</specific>
  </definition>
</wsman-config>
```

Table 88. Collector configuration attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>timeout</code></td>
<td>HTTP Connection and response timeout in milliseconds.</td>
<td>HTTP client default</td>
</tr>
<tr>
<td><code>retry</code></td>
<td>Number of retries on connection failure.</td>
<td>0</td>
</tr>
<tr>
<td><code>username</code></td>
<td>Username for basic authentication.</td>
<td>none</td>
</tr>
<tr>
<td><code>password</code></td>
<td>Password used for basic authentication.</td>
<td>none</td>
</tr>
<tr>
<td><code>port</code></td>
<td>HTTP/S port</td>
<td>Default for protocol</td>
</tr>
<tr>
<td><code>max-elements</code></td>
<td>Maximum number of elements to retrieve in a single request.</td>
<td>no limit</td>
</tr>
<tr>
<td><code>ssl</code></td>
<td>Enable SSL</td>
<td>False</td>
</tr>
<tr>
<td><code>strict-ssl</code></td>
<td>Enforce SSL certificate verification.</td>
<td>True</td>
</tr>
<tr>
<td><code>path</code></td>
<td>Path in the URL to the WS-Management service.</td>
<td>/</td>
</tr>
<tr>
<td><code>product-vendor</code></td>
<td>Used to overwrite the detected product vendor.</td>
<td>none</td>
</tr>
<tr>
<td><code>product-version</code></td>
<td>Used to overwrite the detected product version.</td>
<td>none</td>
</tr>
<tr>
<td><code>gss-auth</code></td>
<td>Enables GSS authentication. When enabled a reverse lookup is performed on the target IP address in order to determine the canonical host name.</td>
<td>False</td>
</tr>
</tbody>
</table>
If you try to connect against Microsoft Windows Server make sure to set specific ports for WinRM connections. By default Microsoft Windows Server uses port TCP/5985 for plain text and port TCP/5986 for SSL connections.

**WS-Management Collection Configuration**

Configuration for the WS-Management collector is stored in `etc/wsman-datacollection-config.xml` and `etc/wsman-datacollection.d/*.xml`.

The contents of these files are automatically merged and reloaded when changed. The default WS-Management collection looks as follows:

```xml
<?xml version="1.0"?>
<wsman-datacollection-config rrd-repository="${install.share.dir}/rrd/snmp/">
  <collection name="default">
    <rrd step="300">
      <rra>RRA:AVERAGE:0.5:1:2016</rra>
      <rra>RRA:AVERAGE:0.5:12:1488</rra>
      <rra>RRA:AVERAGE:0.5:288:366</rra>
      <rra>RRA:MAX:0.5:288:366</rra>
      <rra>RRA:MIN:0.5:288:366</rra>
    </rrd>
    <!-- Include all of the available system definitions -->
    <include-all-system-definitions/>
  </collection>
</wsman-datacollection-config>
```

The magic happens with the `<include-all-system-definitions/>` element which automatically includes all of the system definitions into the collection group.

If required, you can include a specific system-definition with `<include-system-definition>sys-def-name</include-system-definition>`.

System definitions and related groups can be defined in the root `etc/wsman-datacollection-config.xml` file, but it is preferred that be added to a device specific configuration files in `etc/wsman-datacollection-config.d/*.xml`.

Avoid modifying any of the distribution configuration files and create new ones to store you specific details instead.

Here is an example configuration file for a Dell iDRAC:

```xml
<...configuration file content...>
```
<?xml version="1.0"?>
<wsman-datacollection-config>
  <group name="drac-system"
    resource-type="node">
    <attrib name="OtherIdentifyingInfo" index-of="#IdentifyingDescriptions matches '.*ServiceTag'" alias="serviceTag" type="String"/>
  </group>

  <group name="drac-power-supply"
    resource-uri="http://schemas.dmtf.org/wbem/wscim/1/*"
    dialect="http://schemas.microsoft.com/wbem/wsman/1/WQL"
    filter="select InputVoltage,InstanceID,PrimaryStatus,SerialNumber,TotalOutputPower from DCIM_PowerSupplyView where DetailedState != 'Absent'"
    resource-type="dracPowerSupplyIndex">
    <attrib name="InputVoltage" alias="inputVoltage" type="Gauge"/>
    <attrib name="InstanceID" alias="instanceId" type="String"/>
    <attrib name="PrimaryStatus" alias="primaryStatus" type="Gauge"/>
    <attrib name="SerialNumber" alias="serialNumber" type="String"/>
    <attrib name="TotalOutputPower" alias="totalOutputPower" type="Gauge"/>
  </group>

  <system-definition name="Dell iDRAC (All Version)">
    <rule>#productVendor matches '^Dell.*' and #productVersion matches '.*iDRAC.*'</rule>
    <include-group>drac-system</include-group>
    <include-group>drac-power-supply</include-group>
  </system-definition>
</wsman-datacollection-config>

System Definitions

Rules in the system definition are written using SpEL expressions.

The expression has access to the following variables in its evaluation context:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>(root)</td>
<td>org.opennms.netmgt.model.OnmsNode</td>
</tr>
<tr>
<td>agent</td>
<td>org.opennms.netmgt.collection.api.CollectionAgent</td>
</tr>
<tr>
<td>productVendor</td>
<td>java.lang.String</td>
</tr>
<tr>
<td>productVersion</td>
<td>java.lang.String</td>
</tr>
</tbody>
</table>

If a particular agent is matched by any of the rules, then the collector will attempt to collect the referenced groups from the agent.
Group Definitions

Groups are retrieved by issuing an Enumerate command against a particular Resource URI and parsing the results. The Enumerate commands can include an optional filter in order to filter the records and attributes that are returned.

When configuring a filter, you must also specify the dialect.

The resource type used by the group must be of type node or a generic resource type. Interface level resources are not supported.

When using a generic resource type, the IndexStorageStrategy cannot be used since records have no implicit index. Instead, you must use an alternative such as the SiblingColumnStorageStrategy.

If a record includes a multi-valued key, you can collect the value at a specific index with an index-of expression. This is best demonstrated with an example. Let’s assume we wanted to collect the ServiceTag from the following record:

```
<IdentifyingDescriptions>CIM:GUID</IdentifyingDescriptions>
<IdentifyingDescriptions>CIM:Tag</IdentifyingDescriptions>
<IdentifyingDescriptions>DCIM:ServiceTag</IdentifyingDescriptions>
<OtherIdentifyingInfo>45454C4C-3700-104A-8052-C3C01BB25031</OtherIdentifyingInfo>
<OtherIdentifyingInfo>mainsystemchassis</OtherIdentifyingInfo>
<OtherIdentifyingInfo>C8BBBP1</OtherIdentifyingInfo>
```

Specifying, the attribute name OtherIdentifyingInfo would not be sufficient, since there are multiple values for that key. Instead, we want to retrieve the value for the OtherIdentifyingInfo key at the same index where IdentifyingDescriptions is set to DCIM:ServiceTag.

This can be achieved using the following attribute definition:

```
<attrib name="OtherIdentifyingInfo" index-of="#IdentifyingDescriptions matches ".*ServiceTag" alias="serviceTag" type="String"/>
```

Special Attributes

A group can contain the placeholder attribute ElementCount that, during collection, will be populated with the total number of results returned for that group. This can be used to threshold on the number results returned by an enumeration.
6.2.12. XmlCollector

The XmlCollector collects and extracts metrics from XML and JSON documents.

Collector Facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.protocols.xml.collector.XmlCollector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Package</td>
<td>core</td>
</tr>
<tr>
<td>Supported on Minion</td>
<td>Yes (see limitations)</td>
</tr>
</tbody>
</table>

Limitations on Minion

The following handlers are not currently supported on Minion:

- DefaultJsonCollectionHandler
- Sftp3gppXmlCollectionHandler
- Sftp3gppVTDXmlCollectionHandler

Collector Parameters

Use these parameters in the collectd-configuration.xml file.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>collection</td>
<td>The name of the XML Collection to use.</td>
<td>required</td>
<td>-</td>
</tr>
<tr>
<td>handler-class</td>
<td>Class that performs the collection.</td>
<td>optional</td>
<td>org.opennms.protocols.xml.collector.DefaultXmlCollectionHandler</td>
</tr>
</tbody>
</table>

The available handlers include:

- org.opennms.protocols.xml.collector.DefaultXmlCollectionHandler
- org.opennms.protocols.xml.collector.Sftp3gppXmlCollectionHandler
- org.opennms.protocols.xml.vtdxml.DefaultVTDXmlCollectionHandler
XML Collection Configuration

Understanding resource types helps when editing collector-specific configuration files.

XML Collections are defined in etc/xml-datacollection-config.xml and etc/xml-datacollection/.

This snippet provides a collection definition named xml-opennms-nodes:

```xml
<xml-collection name="xml-opennms-nodes">
  <rrd step="300">
    <rra>RRA:AVERAGE:0.5:1:2016</rra>
    <rra>RRA:AVERAGE:0.5:12:1488</rra>
    <rra>RRA:AVERAGE:0.5:288:366</rra>
    <rra>RRA:MAX:0.5:288:366</rra>
    <rra>RRA:MIN:0.5:288:366</rra>
  </rrd>
  <xml-source url="http://admin:admin@{ipaddr}:8980/opennms/rest/nodes">
    <request method="GET">
      <parameter name="use-system-proxy" value="true"/>
    </request>
  </xml-source>
</xml-collection>
```

The request element can have the following child elements:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>The connection and socket timeout in milliseconds</td>
<td>optional</td>
<td></td>
</tr>
<tr>
<td>retries</td>
<td>How often should the request be repeated in case of an error?</td>
<td>optional</td>
<td>0</td>
</tr>
<tr>
<td>use-system-proxy</td>
<td>Should the system-wide proxy settings be used? Configure the system proxy settings via system properties</td>
<td>optional</td>
<td>false</td>
</tr>
</tbody>
</table>

The referenced opennms-nodes.xml file contains:
With the configuration in place, you can test it using the `collect` command available in the *Karaf Shell*:

```
opennms:collect -n 1 org.opennms.protocols.xml.collector.XmlCollector 127.0.0.1
collection=xml-opennms-nodes
```

### Caveats

The `org.opennms.protocols.json.collector.DefaultJsonCollectionHandler` requires the fetched document to be single element of type object to make xpath query work. If the root element is an array, it will be wrapped in an object, whereas the original array is accessible as `/elements`.

### 6.2.13. XmpCollector

The *XmpCollector* collects performance metrics via the X/Open Management Protocol API (XMP) protocol.

#### Collector Facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th><code>org.opennms.netmgt.protocols.xmp.collector.XmpCollector</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Package</td>
<td>opennms-plugin-protocol-xmp</td>
</tr>
<tr>
<td>Supported on Minion</td>
<td>No</td>
</tr>
</tbody>
</table>

#### Collector Parameters

Use these parameters in the `collectd-configuration.xml` file.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>collection</code></td>
<td>The name of the <em>XMP Collection</em> to use.</td>
<td>required</td>
<td></td>
</tr>
<tr>
<td><code>port</code></td>
<td>The TCP port on which the agent communicates.</td>
<td>required</td>
<td></td>
</tr>
<tr>
<td><code>authenUser</code></td>
<td>The username used for authenticating to the agent.</td>
<td>optional</td>
<td>(none)</td>
</tr>
<tr>
<td><code>timeout</code></td>
<td>The timeout used when communicating with the agent.</td>
<td>optional</td>
<td>3000</td>
</tr>
<tr>
<td><code>retry</code></td>
<td>The number of retries permitted when timeout expires.</td>
<td>optional</td>
<td>0</td>
</tr>
</tbody>
</table>
6.3. Resource Types

Resource types group sets of performance data measurements for persisting, indexing, and display in the web UI. Each resource type has a unique name, label definitions for display in the UI, and strategy definitions for archiving the measurements for long-term analysis.

There are two labels for a resource type. The first, `label`, defines a string to display in the UI. The second, `resourceLabel`, defines the template used when displaying each unique group of measurements name for the resource type.

There are two types of strategy definitions for resource types, persistence selector and storage strategies. The persistence selector strategy filters the group indexes down to a subset for storage on disk. The storage strategy is used to convert an index into a resource path label for persistence. There are two special resource types that do not have a resource-type definition. They are `node` and `ifIndex`.

Resource types can be defined inside files in either `$OPENNMS_HOME/etc/resource-types.d` or `$OPENNMS_HOME/etc/datacollection`, with the latter being specific for SNMP.

Here is the `diskIOIndex` resource type definition from `$OPENNMS_HOME/etc/datacollection/netsnmp.xml`:

```xml
<resourceType name="diskIOIndex" label="Disk IO (UCD-SNMP MIB)"
resourceLabel="${diskIODevice} (index ${index})">
  <persistenceSelectorStrategy class="org.opennms.netmgt.collection.support.PersistRegexSelectorStrategy">
    <parameter key="match-expression" value="not(${diskIODevice} matches '^(loop|ram).*')" />
  </persistenceSelectorStrategy>
  <storageStrategy class="org.opennms.netmgt.dao.support.SiblingColumnStorageStrategy">
    <parameter key="sibling-column-name" value="diskIODevice" />
    <parameter key="replace-all" value="s/-//" />
    <parameter key="replace-all" value="s/\s//" />
    <parameter key="replace-all" value="s/:\.*//" />
  </storageStrategy>
</resourceType>
```

### Persistence Selector Strategies

*Table 91. Persistence Selector Strategies*

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>org.opennms.netmgt.collection.support.PersistAllSelectorStrategy</td>
<td>Persist All indexes</td>
</tr>
<tr>
<td>org.opennms.netmgt.collection.support.PersistRegexSelectorStrategy</td>
<td>Persist indexes based on JEXL evaluation</td>
</tr>
</tbody>
</table>
PersistRegexSelectorStrategy

The PersistRegexSelectorStrategy class takes a single parameter, `match-expression`, which defines a JEXL expression. On evaluation, this expression should return either true, persist index to storage, or false, discard data.

**Storage Strategies**

*Table 92. Storage Strategies*

<table>
<thead>
<tr>
<th>Class</th>
<th>Storage Path Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>org.opennms.netmgt.collection.support.IndexStorageStrategy</td>
<td>Index</td>
</tr>
<tr>
<td>org.opennms.netmgt.collection.support.JexlIndexStorageStrategy</td>
<td>Value after JexlExpression evaluation</td>
</tr>
<tr>
<td>org.opennms.netmgt.collection.support.ObjectNameStorageStrategy</td>
<td>Value after JexlExpression evaluation</td>
</tr>
<tr>
<td>org.opennms.netmgt.dao.support.FrameRelayStorageStrategy</td>
<td>interface label + '.' + dlci</td>
</tr>
<tr>
<td>org.opennms.netmgt.dao.support.FileSystemStorageStrategy</td>
<td>Uses the value from the hrStorageDescr column in the hrStorageTable, cleaned up for unix filesystems.</td>
</tr>
<tr>
<td>org.opennms.netmgt.dao.support.SiblingColumnStorageStrategy</td>
<td>Uses the value from an SNMP lookup of OID in sibling-column-name parameter, cleaned up for unix filesystems.</td>
</tr>
<tr>
<td>org.opennms.protocols.xml.collector.XmlStorageStrategy</td>
<td>Index, but cleaned up for unix filesystems.</td>
</tr>
</tbody>
</table>

**IndexStorageStrategy**

The IndexStorageStrategy takes no parameters.

**JexlIndexStorageStrategy**

The JexlIndexStorageStrategy takes two parameters, `index-format` which is required, and `clean-output` which is optional.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index-format</td>
<td>The JexlExpression to evaluate</td>
</tr>
<tr>
<td>clean-output</td>
<td>Boolean to indicate whether the index value is cleaned up.</td>
</tr>
</tbody>
</table>

If the index value will be cleaned up, then it will have all whitespace, colons, forward and backslashes, and vertical bars replaced with underscores. All equal signs are removed.

This class can be extended to create custom storage strategies by overriding the `updateContext` method to set additional key/value pairs to use in your `index-format` template.
public class ExampleStorageStrategy extends JexlIndexStorageStrategy {

    private static final Logger LOG = LoggerFactory.getLogger(ExampleStorageStrategy.class);
    public ExampleStorageStrategy() {
        super();
    }

    @Override
    public void updateContext(JexlContext context, CollectionResource resource) {
        context.set("Example", resource.getInstance());
    }
}

ObjectNameStorageStrategy

The ObjectNameStorageStrategy extends the JexlIndexStorageStrategy, so its requirements are the same. Extra key/values pairs are added to the JexlContext which can then be used in the index-format template. The original index string is converted to an ObjectName and can be referenced as ${ObjectName}. The domain from the ObjectName can be referenced as ${domain}. All key properties from the ObjectName can also be referenced by ${key}.

This storage strategy is meant to be used with JMX MBean datacollections where multiple MBeans can return the same set of attributes. As of OpenNMS Horizon 20, this is only supported using a HTTP to JMX proxy and using the XmlCollector as the JmxCollector does not yet support indexed groups.

Given an MBean like java.lang:type=MemoryPool,name=Survivor Space, and a storage strategy like this:

<storageStrategy class="org.opennms.netmgt.collection.support.ObjectNameStorageStragegy">
    <parameter key="index-format" value="${domain}_${type}_${name}" />
    <parameter key="clean-output" value="true" />
</storageStrategy>

Then the index value would be java.lang.MemoryPool_Survivor_Space.

FrameRelayStorageStrategy

The FrameRelayStorageStrategy takes no parameters.

HostFileSystemStorageStrategy

The HostFileSystemStorageStrategy takes no parameters. This class is marked as deprecated, and can be replaced with:
<storageStrategy class="org.opennms.netmgt.dao.support.SiblingColumnStorageStrategy">
  <parameter key="sibling-column-name" value="hrStorageDescr" />
  <parameter key="replace-first" value="s/^-$/_root_fs/" />
  <parameter key="replace-all" value="s/^//" />
  <parameter key="replace-all" value="s/\s//" />
  <parameter key="replace-all" value="s/:\\.*//" />
</storageStrategy>

### SiblingColumnStorageStrategy

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sibling-column-name</td>
<td>Alternate string value to use for index</td>
</tr>
<tr>
<td>replace-first</td>
<td>Regex Pattern, replaces only the first match</td>
</tr>
<tr>
<td>replace-all</td>
<td>Regex Pattern, replaces all matches</td>
</tr>
</tbody>
</table>

Values for **replace-first**, and **replace-all** must match the pattern `s/regex/replacement/` or an error will be thrown.

### XmlStorageStrategy

This XmlStorageStrategy takes no parameters. The index value will have all whitespace, colons, forward and back slashes, and vertical bars replaced with underscores. All equal signs are removed.

### 6.4. SNMP Property Extenders

When collecting tabular numeric metrics from a given MIB table, it's helpful to include one or more string properties from each conceptual row of the table in question. These properties can be used in the **resourceLabel** attribute of the **resourceType** associated with the collected data. When the string property exists as a column in the same table that contains the numeric metrics, it's easy to associate the string to the correct resource by adding a `mibObj` with the same `instance` attribute and a type of `string`.

For example, the Cisco ENVMON MIB's temperature status table contains both a numeric gauge for the temperature value and a string describing the associated temperature sensor. A partial walk of this table illustrates this very direct relationship:

<table>
<thead>
<tr>
<th>ciscoEnvMonTemperatureStatusIndex</th>
<th>ciscoEnvMonTemperatureStatusDescr (.1.3.6.1.4.1.9.9.13.1.3.1.2)</th>
<th>ciscoEnvMonTemperatureStatusValue (.1.3.6.1.4.1.9.9.13.1.3.1.3)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>I/O Cont Inlet</td>
<td>22</td>
</tr>
<tr>
<td>2</td>
<td>I/O Cont Outlet</td>
<td>23</td>
</tr>
<tr>
<td>3</td>
<td>NPE Inlet</td>
<td>22</td>
</tr>
<tr>
<td>4</td>
<td>NPE Outlet</td>
<td>24</td>
</tr>
</tbody>
</table>
To collect the `ciscoEnvMonTemperatureStatusDescr` and `ciscoEnvMonTemperatureStatusValue` columns within an SNMP data-collection group, all that's needed is a `resourceType` and a `group` to hold the two `mibObj` elements corresponding to these two columns. The `mibObj` aliases are shortened to maintain compatibility with storage engines that limit the length of column names to 19 characters.

```xml
<resourceType name="ciscoEnvMonTemperatureStatusIndex" label="Cisco Temperature"
resourceLabel="${cvmTempStatusDescr} (index ${index})">
  <persistenceSelectorStrategy class="org.opennms.netmgt.collection.support.PersistAllSelectorStrategy"/>
  <storageStrategy class="org.opennms.netmgt.collection.support.IndexStorageStrategy"/>
</resourceType>
...
<group name="cisco-temperature" ifType="all">
  <mibObj oid=".1.3.6.1.4.1.9.9.13.1.3.1.2" instance="ciscoEnvMonTemperatureStatusIndex" alias="cvmTempStatusDescr" type="string"/>
  <mibObj oid=".1.3.6.1.4.1.9.9.13.1.3.1.3" instance="ciscoEnvMonTemperatureStatusIndex" alias="cvmTempStatusValue" type="gauge"/>
</group>
```

Even in cases where the string property exists in a separate MIB table, it's straightforward to include it as long as the "source" table uses an identical set of index variables. For example, the `ifXTable` augments the `ifTable`, meaning the two tables use the same set of instance identifiers – namely `ifIndex`. Whether or not the MIB definition of the second table declares an `AUGMENTS` relationship to the first table, objects from tables with this kind of relationship can be mixed in the same group.

In this contrived configuration example, `ifDescr` (which is from `ifTable`) is freely mixed with `ifName` and `ifAlias` (from `ifXTable`):

```xml
<group name="mib2-string-properties-example" ifType="all">
  <mibObj oid=".1.3.6.1.2.1.2.2.1.2" instance="ifIndex" alias="ifDescr" type="string"/>
  <mibObj oid=".1.3.6.1.2.1.31.1.1.1" instance="ifIndex" alias="ifName" type="string"/>
  <mibObj oid=".1.3.6.1.2.1.31.1.1.18" instance="ifIndex" alias="ifAlias" type="string"/>
</group>
```

Most SNMP property extenders make it possible to include string properties from a "source" MIB table that is indexed differently from the table containing most of the relevant data. For purposes of configuring property extenders, the table containing the majority of the data (and into which we want to include the string properties) is called the `target table`, and the table containing the string property is called the `source table`. Several different extenders are available; selecting the right one depends on the relationship between the target table and the source table.

A few property extenders also exist whose effect is strictly local to the "target" resource. These extenders are useful for dealing in partial indices and other similar operations that do not involve
looking outside the target MIB table.

SNMP Property Extenders are used in the context of a property element inside an SNMP data-collection group parent element. The property element, when it appears, is a sibling of any mibObj elements beneath the same parent group. The instance and alias attributes of the property element are both required, and serve the same purpose as the same attributes of mibObj. The class-name attribute of the property element contains the full class name (including package) of the Property Extender class needed to join the source and target tables. The property element takes a number of parameter child elements; these parameters are used to configure the property extender class named in class-name. Each extender class recognizes a different set of parameters.

6.4.1. Cisco CBQoS Property Extender

This property extender is used only in very specific circumstances.

When to Use Cisco CBQoS Property Extender

The Cisco CBQoS Property Extender is designed specifically and exclusively for the purpose of including string properties across ifXTable and the several MIB tables that make up the Cisco Class-Based QoS MIB. It is not useful for any other sets of target and source tables.

Configuring Cisco CBQoS Extended Properties

The complex relationships among the various Cisco CBQoS tables are encapsulated in the code of this property extender class. As a result, this extender takes only a single parameter, target-property, whose value must be one of policyName, classMapName, interfaceAlias, or interfaceName.

6.4.2. Enum Lookup Property Extender

The Enum Lookup property extender provides a mechanism that works like a lookup table for values of a local MIB table column.

When to use the Enum Lookup Property Extender

The Enum Lookup property extender may be used to map an enumerated set of integer values to a corresponding set of human-sensible textual values. For example, the dot1dStpPortTable contains two integer columns whose values reflect attributes of a port.
dot1dStpPortState OBJECT-TYPE ①
SYNTAX      INTEGER {
    disabled(1),
    blocking(2),
    listening(3),
    learning(4),
    forwarding(5),
    broken(6)
}
-- ...

dot1dStpPortEnable OBJECT-TYPE ②
SYNTAX      INTEGER {
    enabled(1),
    disabled(2)
}

① Port STP state enumerated type
② Port enablement status enumerated type

This extender enables persisting the values of these enumerated integer columns as text that an operator can easily recognize.

While this extender is intended primarily for translating integer values to more descriptive ones as shown in the example below, it could also be used to translate from one set of alphanumeric values to another set.

Configuring the Enum Lookup Property Extender

The Enum Lookup property extender expects zero or more parameters. Only the default-value parameter has a fixed name; if it is present, its value is used any time a lookup cannot be completed. If default-value is not provided and a lookup fails, no value will be returned for the property. The remaining parameters are named for the input values, and their values represent the output values.

This example shows how to map values of dot1dStpPortState and dot1dStpPortEnable to their textual equivalents.
<resourceType name="dot1dStpPortEntry" label="dot1d STP Port" resourceLabel="${index}"/>
<persistenceSelectorStrategy class="org.opennms.netmg.collection.support.PersistAllSelectorStrategy"/>
<storageStrategy class="org.opennms.netmg.collection.support.IndexStorageStrategy"/>
</resourceType>

...<groups>
<group name="dot1dStpPortTable" ifType="all">
<mibObj oid=".1.3.6.1.2.1.17.2.15.1.3" instance="dot1dStpPortEntry" alias="dot1dStpPortState" type="string"/>
<mibObj oid=".1.3.6.1.2.1.17.2.15.1.4" instance="dot1dStpPortEntry" alias="dot1dStpPortEnable" type="string"/>
<mibObj oid=".1.3.6.1.2.1.17.2.15.1.10" instance="dot1dStpPortEntry" alias="dot1dStpPortFwTrans" type="counter"/>
</group>
</groups>

① Port STP state enumerated integer attribute
② Port enablement status enumerated integer attribute
③ Derived port STP state textual attribute dot1dStpPortStateText
④ Derived port enablement status textual attribute dot1dStpPortEnableText

6.4.3. Index Split Property Extender

The Index Split property extender enables extraction of part of a resource's local instance identifier.
When to use the Index Split Property Extender

The Index Split property extender is useful when collecting data from tables with compound indices, because it enables extraction of a single index component. For example, the Cisco Airespace bsnAPIfLoadParametersTable is indexed using the tuple of bsnAPDot3MacAdddress and bsnAPIfSlotId.

```
bsnAPIfLoadParametersEntry OBJECT-TYPE
   -- ...
   DESCRIPTION
   "An entry (conceptual row) in the Table. Entries in this MIB are indexed by bsnAPDot3MacAddress and bsnAPIfSlotId"
   INDEX { bsnAPDot3MacAddress, bsnAPIfSlotId }
   -- ...
```

① bsnAPDot3MacAddress is the first component of the compound index for the entry type for bsnAPIfLoadParametersTable

This extender enables extraction of just the bsnAPIfSlotId component for use in a resource label.

Configuring the Index Split Property Extender

The Index Split property extender expects a single parameter, index-pattern, whose value is a regular expression. The expression must be general enough to match all possible index values for the table at hand, and should include one capturing group. The subpattern matched by the expression’s first capturing group will be returned; any further groups are ignored.

This example shows how to extract just the bsnAPIfSlotId index component as a string property.

```
<group name="bsnAPIfLoadParametersTable" ifType="all">
   <mibObj oid="1.3.6.1.4.1.14179.2.2.13.1.4" instance="bsnAPIfLoadParametersEntry"
      alias="bsnAPIfLoadNumOfCli" type="integer" />
   <property instance="bsnAPIfLoadParametersEntry" alias="slotNumber" class-name="org.opennms.netmgt.collectd.IndexSplitPropertyExtender">
      <parameter key="index-pattern" value="^A.+\.\d+$" />
   </property>
</group>
```

① Derived string property slotNumber

② Regular expression; the portion in parentheses is what gets extracted. \d+ means "one or more decimal digit characters".

6.4.4. Regex Property Extender

The Regex property extender works similarly to the Index Split property extender, with the added
capability of importing a string property from a source table.

When to Use the Regex Property Extender

The Regex property extender is useful when some portion of the target MIB table's index can be used as an index to the source MIB table. For example, the Cisco Airespace bsAPIfLoadParametersTable is indexed using the tuple of bsAPDot3MacAdddress and bsAPIfSlotId, whereas the bsAPTable is indexed on bsAPDot3MacAddress alone.

By extracting just the first index component and using the result as an index into the source MIB table, it's possible to import the human-sensible bsAPName string property from the source MIB table.

Configuring the Regex Property Extender

The Regex property extender expects three parameters, all of which are required:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source-type</td>
<td>The name of the resourceType associated with the source MIB table</td>
</tr>
<tr>
<td>source-alias</td>
<td>The alias name of the string property to be imported from the source MIB table</td>
</tr>
<tr>
<td>index-pattern</td>
<td>A regular expression containing one matching group</td>
</tr>
</tbody>
</table>

① bsAPDot3MacAddress is the first component of the compound index for the entry type for bsAPIfLoadParametersTable

② bsAPDot3MacAddress is the sole index for the entry type for bsAPTable
The `index-pattern` expression must meet the same criteria as for the Index Split property extender. The subpattern matched by its first capturing group will be used as an index into the source MIB table; any further groups are ignored.

This example shows how to use the value of `bsnAPDot3MacAddress` as an index into the `bsnAPTable`.

```xml
<resourceType name="bsnAPEntry" label="Cisco Wireless AP" resourceLabel="${bsnAPName}(index ${index})">
  <persistenceSelectorStrategy class="org.opennms.netmgt.collection.support.PersistAllSelectorStrategy" />
  <storageStrategy class="org.opennms.netmgt.collection.support.IndexStorageStrategy" />
</resourceType>

<resourceType name="bsnAPIfLoadParametersEntry" label="Cisco Wireless AP Resources" resourceLabel="${bsnAPName}(index ${index})">
  <persistenceSelectorStrategy class="org.opennms.netmgt.collection.support.PersistAllSelectorStrategy" />
  <storageStrategy class="org.opennms.netmgt.collection.support.IndexStorageStrategy" />
</resourceType>

<groups>
  <group name="bsnAPTable" ifType="all">
    <mibObj oid=".1.3.6.1.4.1.14179.2.2.1.1.3" instance="bsnAPEntry" alias="bsnAPName" type="string" />
  </group>

  <group name="bsnAPIfLoadParametersTable" ifType="all">
    <mibObj oid=".1.3.6.1.4.1.14179.2.2.13.1.4" instance="bsnAPIfLoadParametersEntry" alias="bsnAPIfLoadNumOfCli" type="integer" />
    <property instance="bsnAPIfLoadParametersEntry" alias="bsnAPName" class-name="org.opennms.netmgt.collectd.RegexPropertyExtender">
      <parameter key="source-type" value="bsnAPEntry" />
      <parameter key="source-alias" value="bsnAPName" />
      <parameter key="index-pattern" value="^(.+).\d+$" />
    </property>
  </group>
</groups>
```

1. Regular string property `bsnAPName` on the source table
2. Extended string property `bsnAPName` on the target table
3. Regular expression; the portion in parentheses is what gets extracted. `\d+` means "one or more decimal digit characters".

### 6.4.5. Pointer-Like Index Property Extender

The Pointer-Like Index property extender makes it possible to use the value of an attribute from the target MIB table as the index into the source MIB table. Unlike the Index Split and Regex extenders,
this extender class does not require the target and source MIB tables to share any index components.

**When to Use the Pointer-Like Index Property Extender**

The Pointer-Like Index property extender is useful when the target MIB table contains a column whose value can be used as an index into the source MIB table. For example, the Cisco Process MIB's `cpmCPUTotalTable` has its own index that is not shared with any other tables, but its `cpmCPUTotalPhysicalIndex` column contains an integer which can be used as an index into the `entPhysicalTable`.

```
cpmCPUTotalEntry OBJECT-TYPE
   -- ...
   DESCRIPTION
   "Overall information about the CPU load. Entries in this table come and go as CPUs are added and removed from the system."
   INDEX { cpmCPUTotalIndex } ①
   -- ...

cpmCPUTotalPhysicalIndex OBJECT-TYPE ②
   -- ...
   DESCRIPTION
   "The `entPhysicalIndex` of the physical entity for which the CPU statistics in this entry are maintained. The physical entity can be a CPU chip, a group of CPUs, a CPU card etc. The exact type of this entity is described by its `entPhysicalVendorType` value. If the CPU statistics in this entry correspond to more than one physical entity (or to no physical entity), or if the `entPhysicalTable` is not supported on the SNMP agent, the value of this object must be zero."
   -- ...

entPhysicalEntry OBJECT-TYPE
   -- ...
   DESCRIPTION
   "Information about a particular physical entity. Each entry provides objects (entPhysicalDescr, entPhysicalVendorType, and entPhysicalClass) to help an NMS identify and characterize the entry, and objects (entPhysicalContainedIn and entPhysicalParentRelPos) to help an NMS relate the particular entry to other entries in this table."
   INDEX { entPhysicalIndex } ③
   -- ...
```

① The `cpmCPUTotalTable` entry type is indexed on `cpmCPUTotalIndex`, which has no meaning outside this table.
The `cpmCPUTotalPhysicalIndex` column contains a value of `entPhysicalIndex` corresponding to the CPU referenced in a given row.

The `entPhysicalTable` entry type is indexed on `entPhysicalIndex` and provides many useful textual columns.

By treating `cpmCPUTotalPhysicalIndex` somewhat like a pointer, it's possible to import string properties from the `entPhysicalTable` for use in the resource-label.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>source-type</code></td>
<td>The name of the <code>resourceType</code> associated with the source MIB table</td>
</tr>
<tr>
<td><code>source-attribute</code></td>
<td>The alias name of the string property to be imported from the source MIB</td>
</tr>
<tr>
<td><code>target-index-pointer-column</code></td>
<td>The alias name of the column in the target MIB table whose value may be</td>
</tr>
<tr>
<td></td>
<td>used as an index into the source MIB table</td>
</tr>
</tbody>
</table>

Some combinations of Cisco hardware and software appear to use values of `cpmCPUTotalIndex` that are directly interchangeable with `entPhysicalIndex`. This relationship does not hold across all product lines or software revisions.

Configuring the Pointer-Like Index Property Extender

The Pointer-Like Index property extender expects three parameters, all of which are required:

This example shows how to use `cpmCPUTotalPhysicalIndex` as a pointer-like index into the `entPhysicalTable`. The target resource gains a pair of string properties, which we will call `cpmCPUTotalName` and `cpmCPUTotalDescr`. 

218
First we collect `entPhysicalDescr` and `entPhysicalName` in the source group, which uses a resource-type associated with the `entPhysicalTable`. Then we collect the pointer-like `cpmCPUTotalPhysicalIndex` in the target group, whose resource-type is associated with the `cpmCPUTotalTable`. We derive `cpmCPUTotalName` in the target group telling the extender to use the pointer-like property's value as an index into the source table, and specify that we want to "pull
over" the source attribute entPhysicalName <5> <6> Deriving cpmCPUTotalDescr is almost identical, except that this time we are pulling over the value of entPhysicalDescr <7>

6.4.6. SNMP Interface Property Extender

The SNMP Interface property extender does much the same job as the Pointer-Like Index property extender, but it is specialized for importing properties from the ifTable. Resources representing rows in the ifTable are modeled differently in OpenNMS Horizon compared to other tabular resource types, and this extender accounts for those differences.

When to Use the SNMP Interface Property Extender

Use the SNMP Interface property extender when the string property you want to import is associated with a network interface which is represented by a row in the ifTable. For example, the dot1dBasePortTable has its own index which does not share any components with any other table, but its dot1dBasePortIfIndex column contains a value that is a valid ifIndex.

```plaintext

dot1dBasePortEntry OBJECT-TYPE
    -- ...
    DESCRIPTION
        "A list of information for each port of the bridge."
    -- ...
    INDEX  { dot1dBasePort } ①
    -- ...

dot1dBasePortIfIndex OBJECT-TYPE ②
    -- ...
    DESCRIPTION
        "The value of the instance of the ifIndex object, defined in IF-MIB, for the interface corresponding to this port."
    ::= { dot1dBasePortEntry 2 }
    -- ...

ifEntry OBJECT-TYPE
    -- ...
    DESCRIPTION
        "An entry containing management information applicable to a particular interface."
    INDEX  { ifIndex } ③
    ::= { ifTable 1 }
```

① The entry type for dot1dBasePortTable is indexed on dot1dBasePort, which has no significance outside this table

② But dot1dBasePortTable contains column dot1dBasePortIfIndex, which tells us the ifIndex corresponding to the physical port underlying to the associated bridge base port

③ ifIndex is the index of the ifTable entry type (and also of the ifXTable entry type)

By using this extender, it's possible to import string attributes from the ifTable, ifXTable, or
another table that augments the ifTable.

**Configuring the SNMP Interface Property Extender**

The SNMP Interface property extender expects two or three parameters:

*Table 95. SNMP Interface Property Extender Parameters*

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>source-attribute</td>
<td>The alias name of the string property to be imported from the source MIB table</td>
<td>required</td>
<td>–</td>
</tr>
<tr>
<td>source-ifindex-attribute</td>
<td>The name of the column in the source MIB table that contains a value of ifIndex</td>
<td>optional</td>
<td>ifIndex</td>
</tr>
<tr>
<td>target-ifindex-pointer-column</td>
<td>The name of the column in the target MIB table that contains a value of ifIndex</td>
<td>required</td>
<td>–</td>
</tr>
</tbody>
</table>

This example shows how to use dot1dBasePortIfIndex as a pointer-like index to import ifDescr from the ifTable, and ifName and ifAlias from the ifXTable, into a trio of new string properties in the target resource.
<resourceType name="dot1dBasePortEntry" label="dot1d Base Port" resourceLabel="${index}"/>
<storageStrategy class="org.opennms.netmgt.collection.support.IndexStorageStrategy"/>
<persistenceSelectorStrategy class="org.opennms.netmgt.collection.supportPersistAllSelectorStrategy"/>
</resourceType>
<groups>
<group name="ifTable" ifType="all">
  <mibObj oid=".1.3.6.1.2.1.2.1.2.1.1" type="string" />
  <mibObj oid=".1.3.6.1.2.1.2.1.2.1.2" type="string" />
  <mibObj oid=".1.3.6.1.2.1.31.1.1.1.1.1" type="string" />
  <mibObj oid=".1.3.6.1.2.1.31.1.1.1.1.18" type="string" />
</group>
<group name="dot1dBasePortTable" ifType="all">
  <mibObj oid=".1.3.6.1.2.1.17.1.4.1.1" instance="dot1dBasePortEntry" alias="dot1dBasePort" type="string" />
  <mibObj oid=".1.3.6.1.2.1.17.1.4.1.2" instance="dot1dBasePortEntry" alias="dot1dBasePortIfIndex" type="string" />
  <mibObj oid=".1.3.6.1.2.1.17.1.4.1.14" instance="dot1dBasePortEntry" alias="d1dBPMtuExDiscard" type="counter" />
  <mibObj oid=".1.3.6.1.2.1.17.1.4.1.5" instance="dot1dBasePortEntry" alias="d1dBPMtuExDiscard" type="counter" />
  <property instance="dot1dBasePortEntry" alias="dot1dBasePortIfDescr" class-name="org.opennms.netmgt.collection.InterfaceSnmpPropertyExtender">
    <parameter key="source-ifindex-attribute" value="interfaceIndex" />
    <parameter key="source-attribute" value="interfaceDescr" />
    <parameter key="target-ifindex-pointer-column" value="dot1dBasePortIfIndex" />
  </property>
  <property instance="dot1dBasePortEntry" alias="dot1dBasePortIfName" class-name="org.opennms.netmgt.collection.InterfaceSnmpPropertyExtender">
    <parameter key="source-ifindex-attribute" value="interfaceIndex" />
    <parameter key="source-attribute" value="interfaceName" />
    <parameter key="target-ifindex-pointer-column" value="dot1dBasePortIfIndex" />
  </property>
  <property instance="dot1dBasePortEntry" alias="dot1dBasePortIfAlias" class-name="org.opennms.netmgt.collection.InterfaceSnmpPropertyExtender">
    <parameter key="source-ifindex-attribute" value="interfaceIndex" />
    <parameter key="source-attribute" value="interfaceAlias" />
    <parameter key="target-ifindex-pointer-column" value="dot1dBasePortIfIndex" />
  </property>
</group>
</groups>
First we collect all of `ifIndex`, `ifDescr`, `ifName`, and `ifAlias` in a group associated with the `ifIndex` source resource-type, using modified names to avoid collisions with internal workings (the `ifIndex` type is built in, so we do not need a custom resource-type definition for it).

Then we collect the pointer-like column `dot1dBasePortIfIndex` in the target group.

To derive the `dot1dBasePortIfDescr` string property, we tell the extender which target attribute contains the pointer-like value, which source column needs to have a matching value, and that we want to "pull over" the `interfaceDescr` property <4> from the source group.

Deriving `dot1dBasePortIfName` is almost identical, except that we want the property `interfaceName` <6> from the source group instead.

Again with `dot1dBasePortIfAlias`, we repeat ourselves except that our desired property from the source group is `interfaceAlias` <8>.

### 6.5. Administration and Troubleshooting

#### 6.5.1. Collectd Administration

This section describes reference and administrative information associated with collectd.

**Table 96. Configuration and log files related to Collectd**

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>$OPENNMS_HOME/etc/collectd-configuration.xml</code></td>
<td>Configuration file for global collectd daemon and collectors configuration. (See Configuring Collectd.)</td>
</tr>
<tr>
<td><code>$OPENNMS_HOME/logs/collectd.log</code></td>
<td>Log file for all collectors and the global collectd daemon.</td>
</tr>
<tr>
<td><code>$OPENNMS_HOME/etc/snmp-graph.properties</code></td>
<td>RRD graph definitions to render performance data measurements in the UI.</td>
</tr>
<tr>
<td><code>$OPENNMS_HOME/etc/snmp-graph.properties.d</code></td>
<td>Directory with RRD graph definitions for devices and applications to render performance data measurements in the UI.</td>
</tr>
<tr>
<td><code>$OPENNMS_HOME/etc/events/opennms.events.xml</code></td>
<td>Event definitions for collectd, i.e., <code>dataCollectionSucceeded</code>, and <code>dataCollectionFailed</code>.</td>
</tr>
<tr>
<td><code>$OPENNMS_HOME/etc/resource-types.d</code></td>
<td>Directory to store generic resource type definitions. (See Resource Types.)</td>
</tr>
</tbody>
</table>

#### 6.5.2. Shell Commands

A number of *Karaf Shell* commands are made available to help administer and diagnose issues related to performance data collection.

To use the commands, log into the *Karaf Shell* on your system using:

```
ssh -p 8101 admin@localhost
```
The Karaf shell uses the same credential as the web interface. Users must be associated with the `ADMIN` role to access the shell.

In order to keep the session open while executing long-running tasks without any user input add `-o ServerAliveInterval=10` to your ssh command.

**Ad hoc collection**

The `opennms:collect` *Karaf Shell* command can be used to trigger and perform a collection on any of the available collectors.

The results of the collection (also referred to as the “collection set”) will be displayed in the console after a successful collection. The resulting collection set will not be persisted, nor will any thresholding be applied.

List all of the available collectors:

```
opennms:list-collectors
```

Invoke the `SnmpCollector` against interface `127.0.0.1` on `NODES:n1`.

```
opennms:collect -n NODES:n1 org.opennms.netmgt.collectd.SnmpCollector 127.0.0.1
```

Invoke the `SnmpCollector` against interface `127.0.0.1` on `NODES:n1` via the `MINION` location.

```
opennms:collect -l MINION -n NODES:n1 org.opennms.netmgt.collectd.SnmpCollector 127.0.0.1
```

Setting the location on the command line will override the node's location.

If you see errors caused by `RequestTimedOutException`s when invoking a collector at a remote location, consider increasing the time to live. By default, `collectd` will use the service interval as the time to live.

Invoke the `JdbcCollector` against `127.0.0.1` while specifying some of the collector parameters.

```
opennms:collect org.opennms.netmgt.collectd.JdbcCollector 127.0.0.1
collection=PostgreSQL driver=org.postgresql.Driver
url=jdbc:postgresql://OPENNMS_JDBC_HOSTNAME/postgres user=postgres
```

Some collectors, such as the `JdbcCollector`, can be invoked without specifying a node.

Persist a collection:

```
```
opennms:collect -l MINION -n NODES=n1 -p org.opennms.netmgt.collectd.SnmpCollector 127.0.0.1

```
-p/--persist option will persist collection set there by introducing an extra datapoint other than data collected during already configured collection interval.
```

A complete list of options is available using:

```
opennms:collect --help
```

**Interpreting the output**

After a successful collection, the collection set will be displayed in the following format:

```
resource a
  group 1
    attribute
    attribute
  group 2
    attribute
resource b
  group 1
    attribute
...
```

The description of the resources, groups and attribute may differ between collectors. This output is independent of the persistence strategy that is being used.

**Measurements & Resources**

The following *Karaf Shell* commands are made available to help enumerate, view and manage measurement related resources.

The `opennms:show-measurement-resources` command can be used to enumerate or lookup resources:
admin@opennms> opennms:show-measurement-resources --node NODES:node --no-children

ID:     node[NODES:node]
Name:   NODES:node
Label:  node
Type:   Node
Link:   element/node.jsp?node=NODES:node

Children:
  node[NODES:node].nodeSnmp[]
  node[NODES:node].interfaceSnmp[lo]
  node[NODES:node].interfaceSnmp[opennms-jvm]
  node[NODES:node].responseTime[192.168.238.140]
  node[NODES:node].responseTime[172.17.0.1]
  node[NODES:node].responseTime[127.0.0.1]
...

The opennms:delete-measurement-resources command can be used to delete resources, and all of the associated metrics:

admin@opennms> opennms:delete-measurement-resources
"node[NODES:node].responseTime[127.0.0.1]"
Deleting measurements and meta-data associated with resource ID 'node[NODES:node].responseTime[127.0.0.1]'...
Done.

The opennms:show-measurements command can be used to render the values of the attributes (measurements) associated with a particular resource:

admin@opennms> opennms:show-measurements -a ifHCInOctets
"node[NODES:node].interfaceSnmp[lo]"
Resource with ID 'node[NODES:node].interfaceSnmp[lo]' has attributes:
[ifHCOutUcastPkts, ifInDiscards, ifHCInBroadcastPkts, ifHCInOctets, ifHCOutOctets, ifOutErrors, ifHCOutMulticastPkts, ifHCInUcastPkts, ifInErrors, ifHCInMulticastPkts, ifHCOutBroadcastPkts, ifOutDiscards]
Limiting attributes to: [ifHCInOctets]

timestamp,ifHCInOctets
Fri Sep 13 13:30:00 EDT 2019,NaN
Fri Sep 13 13:35:00 EDT 2019,NaN
Fri Sep 13 13:40:00 EDT 2019,NaN

The opennms:show-newts-samples command can be used to view the raw samples (collected values) associated with a particular resource.
admin@opennms> opennms:show-newts-samples -a ifHCInOctets
"node[NODES:node].interfaceSnmp[lo]"

Resource with ID 'node[NODES:node].interfaceSnmp[lo]' has attributes:
[ifHCOutUcastPkts, ifInDiscards, ifHCInBroadcastPkts, ifOutErrors, ifHCInOctets,
ifHCOutMulticastPkt, ifHCOutOctets, ifHCInUcastPkts, ifInErrors, ifHCInMulticastPkts,
ifOutDiscards, ifHCOutBroadcastPkt]
Limiting attributes to: [ifHCInOctets]
Fetching samples for Newts resource ID 'snmp:2:lo:mib2-X-interfaces'...
Fri Sep 13 14:31:05 EDT 2019,ifHCInOctets,1271178704.0000

Stress Testing

The opennms:stress-metrics Karaf Shell command can be used to simulate load on the active persistence strategy, whether it be RRDtool, JRobin, or Newts.

The tool works by generating collection sets, similar to those built when performing data collection, and sending these to the active persistence layer. By using the active persistence layer, we ensure that we use the same write path which is used by the actual data collection services.

Generate samples for 10 nodes every 15 seconds and printing the statistic report every 30 seconds:

```
opennms:stress-metrics -n 10 -i 15 -r 30
```

While active, the command will continue to generate and persist collection sets. During this time you can monitor the system I/O and other relevant statistics.

When your done, use CTRL+C to stop the stress tool.

A complete list of options is available using:

```
opennms:stress-metrics --help
```

Interpreting the output

The statistics output by the tool can be be interpreted as follows:

numeric-attributes-generated

The number of numeric attributes that were sent to the persistence layer. We have no guarantee as to whether or not these were actually persisted.

string-attributes-generated

The number of string attributes that were sent to the persistence layer. We have no guarantee as to whether or not these were actually persisted.

batches

The count is used to indicate how many batches of collection sets (one at every interval) were sent to the persistence layer. The timers show how much time was spent generating the batch,
and sending the batch to the persistence layer.
Chapter 7. Thresholding

Thresholding allows you to define limits against network performance metrics of a managed entity to trigger an event when a value goes above or below the specified limit.

- High
- Low
- Absolute Value
- Relative Change

7.1. How Thresholding Works in OpenNMS Horizon

OpenNMS Horizon uses collectors to implement data collection for a particular protocol or family of protocols (SNMP, JMX, HTTP, XML/JSON, WS-Management/WinRM, JDBC, etc.). You can specify configuration for a particular collector in a collection package: essentially the set of instructions that drives the behavior of the collector.

The collectd daemon gathers and stores performance data from these collectors. This is the data against which OpenNMS Horizon applies thresholds. Thresholds trigger events when a specified threshold value is met. You can further create notifications and alarms for threshold events.

7.2. What Triggers a Thresholding Event?

OpenNMS Horizon uses four thresholding algorithms that trigger an event when the datasource value:

- **Low** - equals or drops below the threshold value and re-arms when it equals or comes back up above the re-arm value (e.g., available disk space falls under the specified value)
- **High** - equals or exceeds the threshold value, and re-arms when it equals or drops below the re-arm value (e.g., bandwidth use exceeds the specified amount)
- **Absolute** - changes by the specified amount (e.g., on a fiber-optic link, a change in loss of anything greater than 3 dB is a problem regardless of what the original or final value is)
- **Relative** - changes by percent (e.g., available disk space changes more than 5% from the last poll)
These thresholds can be basic (tested against a single value) or an expression (evaluated against multiple values in an expression).

OpenNMS Horizon applies these algorithms against any performance data (telemetry) collected by collectd or pushed to telemetryd. This includes, but is not limited to, metrics such as CPU load, bandwidth, disk space, etc.

The basic walkthrough focuses on how to set simple thresholds using default values in the OpenNMS Horizon setup. For information on setting and configuring collectors, collectd, and the collectd-configuration.xml file, see Performance Management.

7.3. Basic Walk-through – Thresholding

This section describes how to create a basic threshold for a single, system-wide variable: the number of logged-in users. Our threshold will tell OpenNMS Horizon to create an event when the number of logged-in users on the device exceeds two, and re-arm when it falls below two.

Before creating a threshold, you need to make sure you are collecting the metric against which you want to threshold.

7.3.1. Determine You are Collecting Metric

In this case, we have chosen a metric (number of logged-in users) that is collected by default. We are also using data collected via SNMP. (For information on other collectors, see Collectors.)

1. In the OpenNMS Horizon UI, choose Reports>Resource Graphs.
2. Select one of the listed resources.
3. Under SNMP Node Data, select Node-level Performance Data and choose Graph Selection.
4. Scroll to find the Number of Users graph.
   a. You can click the binoculars icon to display only this graph.

7.3.2. Create a Threshold

1. Select <User_Name>>Configure OpenNMS from the top-right menu.
   a. A screen with a list of preconfigured threshold groups appears. We will work with netsnmp. For information on how to create a threshold group, see Creating a Threshold Group.
3. Click Edit beside the netsnmp group.
4. Click Create New Threshold at the bottom of the Basic Thresholds area of the screen.
5. Set the following information and click Save:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td><strong>high</strong></td>
<td>Triggers an event when the datasource value equals or exceeds the threshold value, and re-arms when it equals or drops below the re-arm value</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td><strong>Datasource</strong></td>
<td>hrSystemNumUsers</td>
<td>Name of the datasource you want to threshold against. For this tutorial, we have provided the datasource for logged-in users. For information on how to determine a metric’s datasource, see Determine the Datasource.</td>
</tr>
<tr>
<td><strong>Datasource label</strong></td>
<td>leave blank</td>
<td>Optional text label. Not required for this tutorial.</td>
</tr>
<tr>
<td><strong>Value</strong></td>
<td>2</td>
<td>The value above which we want to trigger an event. In this case, we want to trigger an event when the number of logged-in users exceeds two.</td>
</tr>
<tr>
<td><strong>Re-arm</strong></td>
<td>2</td>
<td>The value below which we want the system to re-arm. In this case, once the number of logged-in users falls below two.</td>
</tr>
<tr>
<td><strong>Trigger</strong></td>
<td>3</td>
<td>The number of consecutive times the threshold value can occur before the system triggers an event. Since our default polling period is 5 minutes, a value of 3 means OpenNMS Horizon would create a threshold event if there are more than 2 users for 15 minutes.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>leave blank</td>
<td>Optional text to describe your threshold.</td>
</tr>
</tbody>
</table>
7.3.3. Testing the Threshold

To test the threshold we just created, log a second person into the node you are monitoring. Navigate to the Events page. You should see an event that indicates your threshold triggered when more than one user logged in.

Log out the second user. The Events page should indicate that the system has re-armed.

7.3.4. Creating a Threshold for CPU Usage

This procedure describes how to create an expression-based threshold when the five-minute CPU load average metric reaches or goes above 70% for two consecutive measurement intervals. Expression-based thresholds are useful when you need to threshold on a percentage, not the actual value of the data collected.

Expression-based thresholds work only if the data sources in question lie in the same directory.

1. Select <User_Name>>Configure OpenNMS from the top-right menu.
3. Click Edit beside the netsnmp group.
4. Click Create New Expression-based Threshold.
5. Fill in the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>high</td>
<td>Triggers an event when the datasource value equals or exceeds the threshold value, and re-arms when it equals or drops below the re-arm value</td>
</tr>
</tbody>
</table>
| Expression | \((\text{loadavg}5 / 100) / \text{CpuNumCpus} \times 100\) | Divides the five-minute CPU load average by 100 (to obtain the effective load average), which is then divided by the number of CPUs. The value is then multiplied by 100 to provide a percentage.

\(^1\)SNMP does not report in decimals, which is why the expression divides the loadavg5 by 100. |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Datasource type</td>
<td>node</td>
<td>The type of datasource from which you are collecting data.</td>
</tr>
<tr>
<td>Datasource label</td>
<td>leave blank</td>
<td>Optional text label. Not required for this tutorial.</td>
</tr>
<tr>
<td>Value</td>
<td>70</td>
<td>Trigger an event when the five-minute CPU load average goes above 70%.</td>
</tr>
<tr>
<td>Re-arm</td>
<td>50</td>
<td>Re-arm the system when the five-minute CPU load average drops below 50%.</td>
</tr>
<tr>
<td>Trigger</td>
<td>2</td>
<td>The number of consecutive times the threshold value can occur before the system triggers an event. In this case, when the five-minute CPU load average goes above 70% for two consecutive polling periods.</td>
</tr>
<tr>
<td>Description</td>
<td>Trigger an alert when the five-minute CPU load average metric reaches or goes above 70% for two consecutive measurement intervals</td>
<td>Optional text to describe your threshold.</td>
</tr>
<tr>
<td>Triggered UEI</td>
<td>leave blank</td>
<td>See the table in Create a Threshold for details.</td>
</tr>
<tr>
<td>Re-armed UEI</td>
<td>leave blank</td>
<td>See the table in Create a Threshold for details.</td>
</tr>
</tbody>
</table>

6. Click **Save**.

### 7.3.5. Determining the Datasource

Creating a threshold requires the name of the datasource generating the metrics on which you want to threshold. Datasource names for the SNMP protocol appear in *etc/snmp-*
1. To determine the name of the datasource, navigate to the Resource Graphs screen. For example,
   b. Select one of the listed resources.
   c. Under SNMP Node Data, select Node-level Performance Data and choose Graph Selection.

2. Scroll through the graphs to find the title of the graph that displays the metric on which you want to threshold. For example, “Number of Processes” or “System Uptime”:

3. Go to etc/snmp-graph.properties.d/ and search for the title of the graph (for example, “System Uptime”).

4. Note the name of the datasource, and enter it in the Datasource field when you create your threshold.

### 7.3.6. Create a Threshold Group

A threshold group associates a set of thresholds to a service (e.g., thresholds that apply to all Cisco devices). OpenNMS Horizon includes seven preconfigured, editable threshold groups:

- mib2
You can edit an existing group (through the UI) or create a new one (in the `thresholds.xml` file located in `$OPENNMS_HOME/etc/thresholds.xml`). Once you create the group, you can then define it in the `thresholds.xml` file or define it in the UI.

We will create a threshold group called "demo_group".

1. Type the following in the `thresholds.xml` file.

   ```xml
   <group name="demo_group" rrdRepository="/opt/opennms/share/rrd/snmp/>
   </group>
   ```

2. Once you have created the group in the `thresholds.xml` file, switch to the UI, go to the threshold screen and click Request a reload threshold packages configuration.
   a. The group you created should appear in the UI.
3. Click Edit to edit it.

The following is a sample of how the threshold appears in the `thresholds.xml` file:

   ```xml
   <group name="demo_group" rrdRepository="/opt/opennms/share/rrd/snmp/>
   <expression type="high" ds-type="hrStorageIndex" value="90.0"
   rearm="75.0" trigger="2" ds-label="hrStorageDescr"
   filterOperator="or" expression="hrStorageUsed / hrStorageSize * 100.0">
   <resource-filter
   field="hrStorageType">^\d{1,3}\d{1,2}\d{1,2}\d{1,4}\d{1,4}</resource-filter>
   </expression>
   </group>
   ```

   ① The name of the group and the directory of the stored data.
   ② The details of the threshold including type, datasource type, threshold value, rearm value, etc.

### 7.3.7. Create a Notification on a Threshold Event

A custom UEI for each threshold makes it easier to create notifications.

### 7.4. Thresholding Service

The Thresholding Service is the component responsible for maintaining the state of the performance metrics and for generating alarms from these when thresholds are triggered (armed).
or cleared (unarmed).

The thresholding service listens for and visits performance metrics after they are persisted to the time series database.

The state of the thresholds are held in memory and pushed to persistent storage only when they are changed.

### 7.4.1. Distributed Thresholding with Sentinel

Thresholding for streaming telemetry with `telemetryd` is supported on Sentinel when using `Newts`. When running on Sentinel, the thresholding state can be stored in either Cassandra or PostgreSQL. Given that Newts already requires Cassandra, we recommend using Cassandra in order to help minimize the load on PostgreSQL.

Thresholding on Sentinel uses the same configuration files as `OpenNMS Horizon` and operates similarly. When a thresholding changes to/from trigger or cleared, and event is published which is processed by `OpenNMS Horizon` and the alarm is created or updated.

### 7.5. Shell Commands

The following shell commands are made available to help debug and manage thresholding.

Enumerate the persisted threshold states using `opennms:threshold-enumerate`:

```
admin@opennms> opennms:threshold-enumerate
Index   State Key
1       23-127.0.0.1-hrStorageIndex-hrStorageUsed / hrStorageSize * 100.0-/opt/opennms/share/rrd/snmp-RELATIVE_CHANGE
2       23-127.0.0.1-if-ifHCInOctets * 8 / 1000000 / ifHighSpeed * 100-/opt/opennms/share/rrd/snmp-HIGH
3       23-127.0.0.1-node-((loadavg5 / 100) / CpuNumCpus) * 100.0-/opt/opennms/share/rrd/snmp-HIGH
4       23-127.0.0.1-if-ifInDiscards + ifOutDiscards-/opt/opennms/share/rrd/snmp-HIGH
```

Each state is uniquely identified by a state key and aliased by the given index. Indexes are scoped to the particular shell session and provided as an alternative to specifying the complete state key in subsequent commands.

Display state details using `opennms:threshold-details`:

```
admin@opennms> opennms:threshold-details 1
multiplier=1.333
lastSample=64.77758166043765
previousTriggeringSample=28.862826722171075
interpolatedExpression='hrStorageUsed / hrStorageSize * 100.0'
```
Different types of thresholds will display different properties.

Clear a particular persisted state using `opennms:threshold-clear`:

```
admin@opennms> opennms:threshold-clear 2
```

Or clear all the persisted states with `opennms:threshold-clear-all`:

```
admin@opennms> opennms:threshold-clear-all
Clearing all thresholding states....done
```
Chapter 8. Events

Events are central to the operation of the OpenNMS Horizon platform, so it’s critical to have a firm grasp of this topic.

Whenever something in OpenNMS Horizon appears to work by magic, it’s probably events working behind the curtain.

8.1. Anatomy of an Event

Events are structured historical records of things that happen in OpenNMS Horizon and the nodes, interfaces, and services it manages. Every event has a number of fixed fields and zero or more parameters.

Mandatory Fields

UEI (Universal Event Identifier)
A string uniquely identifying the event’s type. UEIs are typically formatted in the style of a URI, but the only requirement is that they start with the string `uei`.

Event Label
A short, static label summarizing the gist of all instances of this event.

Description
A long-form description describing all instances of this event.

Log Message
A long-form log message describing this event, optionally including expansions of fields and parameters so that the value is tailored to the event at hand.

Severity
A severity for this event type. Possible values range from Cleared to Critical.

Event ID
A numeric identifier used to look up a specific event in the OpenNMS Horizon system.

Notable Optional Fields

Operator Instruction
A set of instructions for an operator to respond appropriately to an event of this type.

Alarm Data
If this field is provided for an event, OpenNMS Horizon will create, update, or clear alarms for events of that type according to the alarm-data specifics.

8.2. Sources of Events

Events may originate within OpenNMS Horizon itself or from outside.
Internally-generated events can be the result of the platform’s monitoring and management functions (e.g. a monitored node becoming totally unavailable results in an event with the UEI uei.opennms.org/nodes/nodeDown) or they may act as inputs or outputs of housekeeping processes.

The following subsections summarize the mechanisms by which externally-created events can arrive.

8.2.1. SNMP Traps

If SNMP-capable devices in the network are configured to send traps to OpenNMS Horizon, these traps are transformed into events according to pre-configured rules. The Trapd service daemon, which enables OpenNMS Horizon to receive SNMP traps, is enabled by default.

Disabling the Trapd service daemon will render OpenNMS Horizon incapable of receiving SNMP traps.

Event definitions are included with OpenNMS Horizon for traps from many vendors' equipment.

Traps forwarded via proxy

When SNMP traps are forwarded through a proxy using SNMPv2c or SNMPv3, preserving the original source IP address is a challenge due to the lack of an agent-addr field in the TRAP-V2 PDU used in those protocol versions. RFC 3584 defines an optional varbind snmpTrapAddress (.1.3.6.1.6.3.18.1.3.0) which can be added to forwarded traps to convey the original source IP address.

To configure OpenNMS Horizon to honor snmpTrapAddress when present, set use-address-from-varbind="true" in the top-level element of ${OPENNMS_HOME}/etc/trapd-configuration.xml and restart OpenNMS Horizon.

Configuration example for using RFC 3584 helper varbinds in forwarded traps

```
<trapd-configuration>
    <snmp-trap-port="162" new-suspect-on-trap="false" use-address-from-varbind="true" />
</trapd-configuration>
```

① Top-level trapd-configuration element

② New attribute to enable use of snmpTrapAddress varbind, when present

8.2.2. Syslog Messages

Syslog messages sent over the network to OpenNMS Horizon can be transformed into events according to pre-configured rules.

The Syslogd service daemon, which enables OpenNMS Horizon to receive syslog messages over the network, must be enabled for this functionality to work. This service daemon is disabled by default.
Parsers

Different parsers can be used to convert the syslog message fields into OpenNMS Horizon event fields.

<table>
<thead>
<tr>
<th>Parser</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>org.opennms.netmgt.syslogd.CustomSyslogParser</td>
<td>Parser that uses a regex statement to parse the syslog header.</td>
</tr>
<tr>
<td>org.opennms.netmgt.syslogd.RadixTreeSyslogParser</td>
<td>Parser that uses an internal list of grok-style statements to parse the syslog header.</td>
</tr>
<tr>
<td>org.opennms.netmgt.syslogd.SyslogNGParser</td>
<td>Parser that strictly parses messages in the default pattern of syslog-ng.</td>
</tr>
<tr>
<td>org.opennms.netmgt.syslogd.Rfc5424SyslogParser</td>
<td>Parser that strictly parses the RFC 5424 format for syslog messages.</td>
</tr>
</tbody>
</table>

RadixTreeSyslogParser

The RadixTreeSyslogParser normally uses a set of internally-defined patterns to parse multiple syslog message formats. If you wish to customize the set of patterns, you can put a new set of patterns into a syslog-grok-patterns.txt in the etc directory for OpenNMS Horizon.

The patterns are defined in grok-style statements where each token is defined by a %{PATTERN:semantic} clause. Whitespace in the pattern will match 0…n whitespace characters and character literals in the pattern will match the corresponding characters. The '%' character literal must be escaped by using a backslash, ie. \%.

The RadixTreeSyslogParser’s grok implementation only supports a limited number of pattern types. However, these patterns should be sufficient to parse any syslog message format.

The patterns should be arranged in the file from most specific to least specific since the first pattern to successfully match the syslog message will be used to construct the OpenNMS Horizon event.

<table>
<thead>
<tr>
<th>Pattern</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOSTNAME</td>
<td>String containing only valid hostname characters (alphanumeric plus '.', '-' and '_').</td>
</tr>
<tr>
<td>`HOSTNAMEORIP</td>
<td>String containing only valid hostname characters or IP address characters (IPv4 or IPv6).</td>
</tr>
<tr>
<td>INT</td>
<td>Positive integer.</td>
</tr>
<tr>
<td>`IPADDRESS</td>
<td>String containing only valid IP address characters (IPv4 or IPv6).</td>
</tr>
<tr>
<td>MONTH</td>
<td>3-character English month abbreviation.</td>
</tr>
<tr>
<td>NOSPACE</td>
<td>String that contains no whitespace.</td>
</tr>
<tr>
<td>Pattern</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>STRING</td>
<td>String. Because this matches any character, it must be followed by a delimiter in the pattern string.</td>
</tr>
<tr>
<td>WHITESPACE</td>
<td>String that contains only whitespace (spaces and or tabs).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Semantic Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>day</td>
<td>2-digit day of month (1-31).</td>
</tr>
<tr>
<td>facilityPriority</td>
<td>Facility-priority integer.</td>
</tr>
<tr>
<td>hostname</td>
<td>String hostname (unqualified or FQDN), IPv4 address, or IPv6 address.</td>
</tr>
<tr>
<td>hour</td>
<td>2-digit hour of day (0-23).</td>
</tr>
<tr>
<td>message</td>
<td>Remaining string message.</td>
</tr>
<tr>
<td>messageId</td>
<td>String message ID.</td>
</tr>
<tr>
<td>minute</td>
<td>2-digit minute (0-59).</td>
</tr>
<tr>
<td>month</td>
<td>2-digit month (1-12).</td>
</tr>
<tr>
<td>parm*</td>
<td>String generic parameter where the parameter's key is the identifier following &quot;parm&quot; in the semantic token (e.x. parmComponentId maps to a string parameter with key &quot;ComponentId&quot;).</td>
</tr>
<tr>
<td>processId</td>
<td>String process ID.</td>
</tr>
<tr>
<td>processName</td>
<td>String process name.</td>
</tr>
<tr>
<td>second</td>
<td>2-digit second (0-59).</td>
</tr>
<tr>
<td>secondFraction</td>
<td>1- to 6-digit fractional second value as a string.</td>
</tr>
<tr>
<td>timezone</td>
<td>String timezone value.</td>
</tr>
<tr>
<td>version</td>
<td>Version.</td>
</tr>
<tr>
<td>year</td>
<td>4-digit year.</td>
</tr>
</tbody>
</table>

### 8.2.3. ReST

Posting an event in XML format to the appropriate endpoint in the OpenNMS Horizon ReST API will cause the creation of a corresponding event, just as with the XML-TCP interface.

### 8.2.4. XML-TCP

Any application or script can create custom events in OpenNMS Horizon by sending properly-formatted XML data over a TCP socket.
8.2.5. Receiving IBM Tivoli Event Integration Facility Events

OpenNMS can be configured to receive Events sent using the Tivoli Event Integration Facility. These EIF events are translated into OpenNMS events using preconfigured rules. The resulting UEI are anchored in the uei.opennms.org/vendor/IBM/EIF/ namespace, with the name of the EIF event class appended.

A sample event configuration for the OMEGAMON_BASE class is included with OpenNMS.

Configuring the EIF Adapter

Once OpenNMS is started and the Karaf shell is accessible, you can install the EIF Adapter feature and configure it to listen on a specific interface and port.

By default the EIF Adapter is configured to listen on TCP port 1828 on all interfaces.

OSGi login, installation, and configuration of the EIF Adapter

By default the EIF Adapter is configured to listen on TCP port 1828 on all interfaces.

```
[root@localhost /root]# $ ssh -p 8101 admin@localhost
...
opennms> feature:install eif-adapter
opennms> config:edit org.opennms.features.eifadapter
opennms> config:property-set interface 0.0.0.0
opennms> config:property-set port 1828
opennms> config:update
```

You can check the routes status with the camel:* commands and/or inspect the log with log:tail for any obvious errors. The feature has a debug level logging that can be used to debug operations.

Documentation on using the OSGi console embedded in OpenNMS and the related camel commands.

Features installed through the Karaf shell persist only as long as the ${OPENNMS_HOME}/data directory remains intact. To enable the feature more permanently, add it to the featuresBoot list in ${OPENNMS_HOME}/etc/org.apache.karaf.features.cfg.

You should now be able to configure your EIF forwarders to send to this destination, and their events will be translated into OpenNMS Events and written to the event bus.

Troubleshooting

If events are not reaching OpenNMS, check whether the event source (EIF Forwarder) is correctly configured. Check your event destination configuration. In particular review the HOSTNAME and PORT parameters. Also check that your situations are configured to forward to that EIF destination.

If those appear to be correct verify that the EIF Forwarder can communicate with OpenNMS over the configured port (default 1828).
Review the OSGi log with `log:tail` or the `camel:*` commands.

### 8.2.6. TL1 Autonomous Messages

Autonomous messages can be retrieved from certain TL1-enabled equipment and transformed into events.

> The **TL1d** service daemon, which enables OpenNMS Horizon to receive TL1 autonomous messages, must be enabled for this functionality to work. This service daemon is **disabled** by default.

### 8.2.7. Sink

Events can also be created by routing them to a specific topic on **Kafka / ActiveMQ**.

The topic name should be of the form `OpenNMS.Sink.Events` where `OpenNMS` is default instance id of OpenNMS Horizon. The instance id is configurable through a system property `org.opennms.instance.id`.

### 8.3. The Event Bus

At the heart of OpenNMS Horizon lies an **event bus**. Any OpenNMS Horizon component can **publish** events to the bus, and any component can **subscribe** to receive events of interest that have been published on the bus. This publish-subscribe model enables components to use events as a mechanism to send messages to each other. For example, the provisioning subsystem of OpenNMS Horizon publishes a **node-added** event whenever a new node is added to the system. Other subsystems with an interest in new nodes subscribe to the **node-added** event and automatically receive these events, so they know to start monitoring and managing the new node if their configuration dictates. The publisher and subscriber components do not need to have any knowledge of each other, allowing for a clean division of labor and lessening the programming burden to add entirely new OpenNMS Horizon subsystems or modify the behavior of existing ones.

#### 8.3.1. Associate an Event to a given node

There are 2 ways to associate an existing node to a given event prior sending it to the Event Bus:

- Set the **nodeId** of the node in question to the event.
- For requisitioned nodes, set the **_foreignSource** and **_foreignId** as parameters to the event. Then, any incoming event without a **nodeId** and these 2 parameters will trigger a lookup on the DB; if a node is found, the **nodeId** attribute will be dynamically set into the event, regardless which method has been used to send it to the **Event Bus**.

### 8.4. Event Configuration

The back-end configuration surrounding events is broken into two areas: the configuration of **Eventd** itself, and the configuration of all types of events known to OpenNMS Horizon.
8.4.1. The `eventd-configuration.xml` file

The overall behavior of Eventd is configured in the file `OPENNMS_HOME/etc/eventd-configuration.xml`. This file does not need to be changed in most installations. The configurable items include:

**TCP Address**
- The IP address to which the Eventd XML/TCP listener will bind. Defaults to `127.0.0.1`.

**TCP Port**
- The TCP port number on `TCP Address` to which the Eventd XML/TCP listener will bind. Defaults to 5817.

**UDP Address**
- The IP address to which the Eventd XML/UDP listener will bind. Defaults to `127.0.0.1`.

**UDP Port**
- The UDP port number on `TCP Address` to which the Eventd XML/UDP listener will bind. Defaults to 5817.

**receivers**
- The number of threads allocated to service the event intake work done by Eventd.

**queueLength**
- The maximum number of events that may be queued for processing. Additional events will be dropped. Defaults to unlimited.

**getNextEventID**
- An SQL query statement used to retrieve the ID of the next new event. Changing this setting is not recommended.

**socketSoTimeoutRequired**
- Whether to set a timeout value on the Eventd receiver socket.

**socketSoTimeoutPeriod**
- The socket timeout, in milliseconds, to set if `socketSoTimeoutRequired` is set to yes.

**logEventSummaries**
- Whether to log a simple (terse) summary of every event at level INFO. Useful when troubleshooting event processing on busy systems where DEBUG logging is not practical.

8.4.2. The `eventconf.xml` file and its tributaries

The set of known events is configured in `OPENNMS_HOME/etc/eventconf.xml`. This file opens with a `<global>` element, whose `<security>` child element defines which event fields may not be overridden in the body of an event submitted via any Eventd listener. This mechanism stops a malicious actor from, for instance, sending an event whose `operator-action` field amounts to a phishing attack.

After the `<global>` element, this file consists of a series of `<event-file>` elements. The content of
each `<event-file>` element specifies the path of a **tributary file** whose contents will be read and incorporated into the event configuration. These paths are resolved relative to the `OPENNMS_HOME/etc` directory; absolute paths are not allowed.

Each **tributary file** contains a top-level `<events>` element with one or more `<event>` child elements. Consider the following event definition:

```xml
<event>
  <uei>uei.opennms.org/nodes/nodeLostService</uei>
  <event-label>OpenNMS-defined node event: nodeLostService</event-label>
  <descr>
    %interface% outage was identified on interface %interface% because of the following condition: %parm[eventReason]%.
    A new Outage record has been created and service level availability calculations will be impacted until this outage is resolved.
  </descr>
  <logmsg dest="logndisplay">
    %service% outage identified on interface %interface%.
  </logmsg>
  <severity>Minor</severity>
  <alarm-data reduction-key="%uei%:%dpname%:%nodeid%:%interface%:%service%" alarm-type="1" auto-clean="false"/>
</event>
```

Every event definition has this same basic structure. See [Anatomy of an Event](#) for a discussion of the structural elements.

**A word about severities**

When setting severities of events, it's important to consider each event in the context of your infrastructure as a whole. Events whose severity is critical at the zoomed-in level of a single device may not merit a **Critical** severity in the zoomed-out view of your entire enterprise. Since an event with **Critical** severity can never have its alarms escalated, this severity level should usually be reserved for events that unequivocally indicate a truly critical impact to the business. Rock legend Nigel Tufnel offered some wisdom on the subject.

**Replacement tokens**

Various tokens can be included in the description, log message, operator instruction and automatic actions for each event. These tokens will be replaced by values from the current event when the text for the event is constructed. Not all events will have values for all tokens, and some refer specifically to information available only in events derived from SNMP traps.

%-eventid%-  
The event's numeric database ID

%-uei%-  
The Universal Event Identifier for the event.
The source of the event (which OpenNMS Horizon service daemon created it).

The event description.

The event logmsg.

The time of the event.

The time of the event formatted using DateFormat.SHORT for a completely numeric date/time.

The ID of the Minion (formerly distributed poller) that the event was received on.

The numeric node ID of the device that caused the event, if any.

The node label for the node given in %nodeid% if available.

The node location for the node given in %nodeid% if available.

The host at which the event was generated.

The IP interface associated with the event, if any.

The Requisition name for the node given in %nodeid% if available.

The Requisition ID for the node given in %nodeid% if available.

The interface’s SNMP ifIndex.

Does a reverse lookup on the %interface% and returns its name if available.

The service associated with the event, if any.
The severity of the event.

The host of the SNMP agent that generated the event.

The SNMP Enterprise OID for the event.

The decoded (human-readable) SNMP Enterprise OID for the event (?)..

The interface's SNMP ifAlias.

The Generic trap-type number for the event.

The Specific trap-type number for the event.

The community string for the trap.

The SNMP version of the trap.

The SNMP information associated with the event.

The operator instructions for the event.

The mouse over text for the event.

The trouble ticket id associated with the event if available.

The primary interface IP address for the node given in %nodeid% if available.

The use of multiple Minions in one location can break the alarm life-cycle for some OpenNMS features. To avoid this problem, the %dpname% value can always be replaced by an empty string by setting org.opennms.netmgt.eventd.cleardpname to true in the file opennms.properties.

Asset tokens
A node may have additional asset records stored for it. You can access these records using the asset replacement token, which takes the form:

\%asset[<token>]%

The asset field \(<token>\)'s value, or "Unknown" if it does not exist.

**Hardware tokens**

A node may have additional hardware details stored for it. You can access these details using the hardware replacement token, which takes the form:

\%hardware[<token>]%

The hardware field \(<token>\)'s value.

**Parameter tokens**

Many events carry additional information in parameters (see Anatomy of an Event). These parameters may start life as SNMP trap variable bindings, or varbinds for short. You can access event parameters using the parm replacement token, which takes several forms:

\%parm[all]%

Space-separated list of all parameter values in the form \(parmName1="parmValue1" parmName2="parmValue2"\) and so on.

\%parm[values-all]%

Space-separated list of all parameter values (without their names) associated with the event.

\%parm[names-all]%

Space-separated list of all parameter names (without their values) associated with the event.

\%parm[<name>]%

Will return the value of the parameter named \(<name>\) if it exists.

\%parm[#]%

Will return the total number of parameters as an integer.

\%parm[<num>]%

Will return the value of parameter number \(<num>\) (one-indexed).

\%parm[name-<num>]%

Will return the name of parameter number \(<num>\) (one-indexed).

The structure of the eventconf.xml tributary files

The ordering of event definitions is very important, as an incoming event is matched against them in order. It is possible and often useful to have several event definitions which could match variant forms of a given event, for example based on the values of SNMP trap variable bindings.

The tributary files included via the \(<event-file>\) tag have been broken up by vendor. When OpenNMS Horizon starts, each tributary file is loaded in order. The ordering of events inside each tributary file is also preserved.
The tributary files listed at the very end of eventconf.xml contain catch-all event definitions. When slotting your own event definitions, take care not to place them below these catch-all files; otherwise your definitions will be effectively unreachable.

**A few tips**

- To save memory and shorten startup times, you may wish to remove event definition files that you know you do not need.

- If you need to customize some events in one of the default tributary files, you may wish to make a copy of the file containing only the customized events, and slot the copy above the original; this practice will make it easier to maintain your customizations in case the default file changes in a future release of OpenNMS Horizon.

### 8.4.3. Reloading the event configuration

After making manual changes to `OPENNMS_HOME/etc/eventconf.xml` or any of its tributary files, you can trigger a reload of the event configuration by issuing the following command on the OpenNMS Horizon server:

```bash
OPENNMS_HOME/bin/send-event.pl uei.opennms.org/internal/reloadDaemonConfig -p 'daemonName Eventd'
```

### 8.5. Debugging

When debugging events, it may be helpful to lower the minimum severity at which Eventd will log from the default level of WARN. To change this setting, edit `OPENNMS_HOME/etc/log4j2.xml` and locate the following line:

```xml
<KeyValuePair
    key="eventd"
    value="WARN" />
```

Changes to `log4j2.xml` will be take effect within 60 seconds with no extra action needed. At level DEBUG, Eventd will log a verbose description of every event it handles to `OPENNMS_HOME/logs/eventd.log`. On busy systems, this setting may create so much noise as to be impractical. In these cases, you can get terse event summaries by setting Eventd to log at level INFO and setting `logEventSummaries="yes"` in `OPENNMS_HOME/etc/eventd-configuration.xml`. Note that changes to `eventd-configuration.xml` require a full restart of OpenNMS Horizon.

#### 8.5.1. Karaf Shell

The `opennms:show-event-config` command can be used to render the event definition for one or more event UEIs (matching a substring) to XML. This command is useful for displaying event definitions which may not be easily accessible on disk, or verifying that particular events were actually loaded.
$ ssh -p 8101 admin@localhost
...
admin@opennms() > opennms:show-event-config -u uei.opennms.org/alarms
Chapter 9. Alarms

*OpenNMS Horizon* has the ability to monitor the state of problems with its managed entities (ME), their resources, the services they provide, as well as the applications they host; or more simply, *the Network*. In *OpenNMS Horizon*, the state of these problems are characterized as *Alarms*.

**In the beginning, there were Events**

Before Alarmd was created, OpenNMS' Events (or messages) were used not only as interprocess communication messages (IPC), but also as indications of problems in *the network*. Even today, OpenNMS Events still carry problem state attributes such as: Acknowledgement and Severity. However, these attributes have long since been functionally deprecated now that Alarms are used as *the* indicator for problems in the network, (see also Situations and *Business Services*).

A significant change occurred with the release of Horizon 23.0.0 (H23). Prior to H23 and since the introduction of Alarms in OpenNMS, Alarmd was designed and configured to track the state of a problem using two Alarms; a *Down* and an *Up* Alarm. Now, OpenNMS is designed with the intention to use a single Alarm to track the state of a problem. The old behavior can be re-enabled by setting the system property *org.opennms.alarmd.legacyAlarmState = true*.

### 9.1. Single Alarm Tracking Problem States

**First occurrence of a Service Down problem (SNMP), Alarm instantiated**

![Alarm instantiated](image)

**The Service Down Event from the Poller (via clicking on Alarm count)**

![Service Down Event](image)

Alarm is cleared immediately (no longer creating separate Alarm for Normal state)

![Alarm cleared](image)

**Both Service Down and Service restored Events from the Poller**

![Service restored Events](image)

**The Second occurrence of the Service Down problem (SNMP), Alarm reduced**

![Alarm reduced](image)
Both Service Down Events and the previous Service restored Event from the Poller

The Alarm is again cleared immediately (notice counter doesn’t increment)

Both Service Down and restored Events

9.2. Alarm Service Daemon

Alarmd, the Alarm Service Daemon, has the very simple task of processing Events representing problems in the Network. It either instantiates a new alarm for tracking a problem’s state or reducing a reoccurring Event of an existing problem into the same Alarm. (Also known as Alarm de-duplication)

Prior to OpenNMS Horizon version 23.0.0 (H23), Alarmd had no configuration. With the release of H23, Drools is now imbedded directly inline with Alarmd’s Event processing function. This provides users with a more robust infrastructure for the effective management of workflow and problem states in the Network. Business rules now replace the function of the "Automations" that were previously defined in Vacuumd’s configuration. You will find these new business rules in the etc/alarmd/drools-rules.d/ folder.

$OPENNMS_ETC/drools-rules.d/

alarmd.drl
9.3. Configuring Alarms

Since Alarmd instantiates Alarms from Events, defining Alarms in OpenNMS Horizon entails defining an additional XML element of an Event indicating a problem or resolution in the Network. This additional element is the "alarm-data" element.

Any Event that is marked as "donotpersist" in the logmsg element's "dest" attribute, will not be processed as an Alarm.
alarm-data Schema Definition (XSD)

```xml
<element name="alarm-data">
  <annotation>
    <documentation>This element is used for converting events into alarms.</documentation>
  </annotation>
  <complexType>
    <sequence>
      <element ref="this:update-field" minOccurs="0" maxOccurs="unbounded" />
    </sequence>
    <attribute name="reduction-key" type="string" use="required" />
    <attribute name="alarm-type" use="required" >
      <simpleType>
        <restriction base="int">
          <minInclusive value="1"/>
        </restriction>
      </simpleType>
    </attribute>
    <attribute name="clear-key" type="string" use="optional" />
    <attribute name="auto-clean" type="boolean" use="optional" default="false" />
    <attribute name="x733-alarm-type" type="this:x733-alarm-type" use="optional" />
    <attribute name="x733-probable-cause" type="int" use="optional" />
  </complexType>
</element>

<element name="update-field">
  <complexType>
    <attribute name="field-name" type="string" use="required" />
    <attribute name="update-on-reduction" type="boolean" use="optional" default="true" />
    <attribute name="value-expression" type="string" use="optional" default="" />
  </complexType>
</element>

<simpleType name="x733-alarm-type">
  <restriction base="string">
    <pattern value="CommunicationsAlarm|ProcessingErrorAlarm|EnvironmentalAlarm|QualityOfServiceAlarm|EquipmentAlarm|IntegrityViolation|SecurityViolation|TimeDomainViolation|OperationalViolation|PhysicalViolation"/>
  </restriction>
</simpleType>
```

NOTE See also: Anatomy of an Event

*The reduction-key*

The critical attribute when defining the alarm-data of an Event, is the reduction-key. This attribute can contain literal strings as well as references to properties (fields and parameters) of the Event. The purpose of the reduction-key is to uniquely identify the signature of a problem and, as such, is
used to reduce (de-duplicate) Events so that only one problem is instantiated. Most commonly, the event’s identifier (UEI) is used as the left most (least significant) portion of the reduction-key, followed by other properties of the Event from least to most significant and, traditionally, separated with the literal ‘:’.

**Example 1. Multi-part reduction-key**

```xml
<event>
  <uei>uei.opennms.org/nodes/nodeDown</uei>
  ...
  <alarm-data reduction-key="%uei%:%dpname%:%nodeid%" alarm-type="1" auto-clean="false"/>
</event>
```

**Example 2. Least Significant reduction-key Attribute**

Decreasing the significance of the reduction-key is a way to aggregate, for example, all nodes down in to a single alarm. However, there are caveats:

```xml
<event>
  <uei>uei.opennms.org/nodes/nodeDown</uei>
  <alarm-data reduction-key="%uei%" alarm-type="1"/>
</event>
```

With this reduction-key, a single alarm would be instantiated for all nodes that were determined by the Poller to be down. There would be a single alarm with the count representing the number of nodes down. However, the UEI uei.opennms.org/nodes/nodeUp would not be a good “pair wise” reduction-key for resolving this alarm as it would take only a single "node up" to clear all nodes down tracked with this single alarm configuration.

**The alarm-type attribute**

The second most critical attribute is the alarm-type. There are currently three types of alarms: problem (1), resolution (2), and notification (3). The alarm-type attribute helps Alarmd with pair-wise resolution... the matching of resolution events to problem events.

**The clear-key attribute**

This attribute is used in the pair-wise correlation feature of Alarmd. When configuring a resolution Alarm, set this attribute to match the reduction-key of a the corresponding problem Alarm.

**The auto-clean attribute**

This attribute instructs Alarmd to only retain the most recent Event reduced into an alarm. For alarms that are super chatty, this is a way to reduce the size of the most recent Events in the database.
Do not use this feature with Alarms that have pair-wise correlation (matching problems with resolutions).

**The update-field element**

Use this element to override Alarmd's default behavior for which some fields are updated during reduction. The Alarm fields that are currently allowed to be controlled this way are:

- distpoller
- ipaddr
- mouseover
- operinstruct
- severity
- descr
- acktime
- ackuser

With the new single alarm behavior in H23, if an Alarm transitions from an alarm-type 2 back to alarm-type 1 the Severity will be set to the most Event's value.

**Reduction (de-duplication) of Alarms**

Alarmd is designed to reduce multiple occurrences of an Alarm into a single alarm.

**Pairwise Correlation**

Alarmd is also intrinsically designed to automatically match resolving events with an existing Alarm. Alarms with matching resolutions with problems (Ups with Downs), should be indicated with the alarm-type attribute.

- alarm-type="1" (problem alarm)
- alarm-type="2" (resolving alarm)
- alarm-type="3" (notification alarm... alarm with no resolution such as SNMP Authentication Failures)

**Instantiate new Alarms for existing cleared problem**

Also new in H23, a global property setting that controls behavior of alarm reduction of currently cleared Alarms.

Create a properties file called alarmd.properties in the $OPENNMS_ETC/opennms.properties.d/ folder and add the following property set to true:

```
########## Alarmd Properties ##########
#
# Enable this property to force Alarmd to create new alarms when an problem re-occurs and the
# existing Alarm is in a "Cleared" state.
#
# Default: false
#org.opennms.alarmd.newIfClearedAlarmExists = false
org.opennms.alarmd.newIfClearedAlarmExists = true
```

Now, with this property set, when a repeat incident occurs and the current state of the Alarm tracking the problem is "Cleared", instead of restating the current Alarm to it's default severity and incrementing the counter, a new instance of the Alarm will be created.
What happens is that Alarmd will alter the existing Alarm’s reductionKey to be unique. Thus preventing it from ever again being reused for a reoccurring problem in the Network (the literal “:ID:” and the alarm ID is appended to the reductionKey).

**Altered reductionKey**

<table>
<thead>
<tr>
<th>Alarm 163</th>
</tr>
</thead>
<tbody>
<tr>
<td>Severity</td>
</tr>
<tr>
<td>Last Event</td>
</tr>
<tr>
<td>First Event</td>
</tr>
<tr>
<td>Event Source Location</td>
</tr>
<tr>
<td>Count</td>
</tr>
<tr>
<td>Ticket ID</td>
</tr>
<tr>
<td>Reduction Key</td>
</tr>
</tbody>
</table>

### Re-enable legacy dual Alarm state behavior

Now in H23, a global property setting can set to re-enable the legacy dual Alarm behavior.

Create a properties file called alarmd.properties in the $OPENNMS_ETC/opennms.properties.d/ folder and add the following property set to true:

```
# Enable this property to have the traditional dual alarm handling of alarms state
# for Alarm pairwise correlation.
# Default: false
org.opennms.alarmd.legacyAlarmState = false
```

Setting legacyAlarmState will nullify newIfClearedAlarmExists

**9.4. Alarm Notes**

*OpenNMS Horizon* creates an *Alarm* for issues in the network. Working with a few people in a team, it is helpful to share information about a current *Alarm*. *Alarm Notes* can be used to assign comments to a specific *Alarm* or a whole class of *Alarms*. The figure *Alarm Detail View* shows the component to add these information in *Memos* to the *Alarm*.

*Alarm Detail View*
The **Alarm Notes** allows to add two types of notes on an existing **Alarm** or **Alarm Class**:

- **Sticky Memo**: A user defined note for a specific instance of an **Alarm**. Deleting the **Alarm** will also delete the sticky memo.

- **Journal Memo**: A user defined note for a whole class of alarms based on the resolved reduction key. The **Journal Memo** will be shown for all **Alarms** matching a specific reduction key. Deleting an **Alarm** doesn't remove the **Journal Memo**, they can be removed by pressing the “Clear” button on an **Alarm** with the existing **Journal Memo**.

If an **Alarm** has a sticky and/or a **Journal Memo** it is indicated with two icons on the “Alarm list Summary” and "Alarm List Detail".

### 9.5. Alarm Sounds

Often users want an audible indication of a change in alarm state. The **OpenNMS Horizon** alarm list page has the optional ability to generate a sound either on each new alarm or (more annoyingly) on each change to an alarm event count on the page.

The figure **Alarm Sounds View** shows the alarm list page when alarms sounds are enabled.

**Alarm Sounds View**
By default the alarm sound feature is disabled. System Administrators must activate the sound feature and also set the default sound setting for all users. However users can modify the default sound setting for the duration of their logged-in session using a drop down menu with the following options:

- Sound off: no sounds generated by the page.
- Sound on new alarm: sounds generated for every new alarm on the page.
- Sound on new alarm count: sounds generated for every increase in alarm event count for alarms on the page.

### 9.6. Flashing Unacknowledged Alarms

By default, OpenNMS Horizon displays the alarm list page with acknowledged and unacknowledged alarms listed in separate search tabs. In a number of operational environments it is useful to see all of the alarms on the same page with unacknowledged alarms flashing to indicate that they haven’t yet been noticed by one of the team. This allows everyone to see at a glance the real time status of all alarms and which alarms still need attention.

The figure **Alarm Sounds View** also shows the alarm list page when flashing unacknowledged alarms are enabled. Alarms which are unacknowledged flash steadily. Alarms which have been acknowledged do not flash and also have a small tick beside the selection check box. All alarms can be selected to be escalated, cleared, acknowledged and unacknowledged.

### 9.7. Configuring Alarm Sounds and Flashing

By default, OpenNMS Horizon does not enable alarm sounds or flashing alarms. The default settings are included in opennms.properties. However rather than editing the default opennms.properties file, the system administrator should enable these features by creating a new file in opennms.properties.d and applying the following settings:

```
${OPENNMS_HOME}/etc/opennms.properties.d/alarm.listpage.properties
```
Configuration properties related to Alarm sound and flashing visualization

```bash
# ######## Alarm List Page Options ########
# Several options are available to change the default behaviour of the Alarm List Page.
# <opennms url>/opennms/alarm/list.htm
#
# The alarm list page has the ability to generate a sound either on each new alarm
# or (more annoyingly) on each change to an alarm event count on the page.
# # Turn on the sound feature. Set true and Alarm List Pages can generate sounds in the
# web browser.
opennms.alarmlist.sound.enable=true
#
# Set the default setting for how the Alarm List Pages generates sounds. The default
# setting can be
#    off = no sounds generated by the page.
#    newalarm = sounds generated for every new alarm in the page
#    newalarmcount = sounds generated for every increase in alarm event count for
# alarms on the page
# opennms.alarmlist.sound.status=off
#
# By default the alarm list page displays acknowledged and unacknowledged alarms in
# separate search tabs
# Some users have asked to be able to see both on the same page. This option allows
# the alarm list page
# to display acknowledged and unacknowledged alarms on the same list but
# unacknowledged alarms
# flash until they are acknowledged.
# opennms.alarmlist.unackflash=true
```

The sound played is determined by the contents of the following file `${OPENNMS_HOME}/jetty-webapps/opennms/sounds/alert.wav`

If you want to change the sound, create a new wav file with your desired sound, name it `alert.wav` and replace the default file in the same directory.

### 9.8. Alarm History

The Alarm History feature integrates with Elasticsearch to provide long term storage and maintain a history of alarm state changes.

When enabled, alarms are indexed in Elasticsearch when they are created, deleted, or when any of the “interesting” fields on the alarm are updated (more on this below.)

Alarms are indexed in such a fashion that allows operators to answer the following questions:
1. What were all the state changes of a particular alarm?
2. What was the last known state of an alarm at a given point in time?
3. Which alarms were present (i.e. not deleted) on the system at a given point in time?
4. Which alarms are currently present on the system?

A simple REST API is also made available for the purposes of evaluating the results, verifying the data that is stored and providing examples on how to query the data.

9.8.1. Requirements

This feature requires Elasticsearch 7.x.

9.8.2. Setup

Alarm history indexing can be enabled as follows:

First, login to the Karaf shell of your OpenNMS Horizon instance and configure the Elasticsearch client settings to point to your Elasticsearch cluster. See Elasticsearch Integration Configuration for a complete list of available options.

```
$ ssh -p 8101 admin@localhost
...
admin@opennms()> config:edit org.opennms.features.alarms.history.elastic
admin@opennms()> config:property-set elasticUrl http://es:9200
admin@opennms()> config:update
```

Next, install the opennms-alarm-history-elastic feature from that same shell using:

```
admin@opennms()> feature:install opennms-alarm-history-elastic
```

In order to ensure that the feature continues to be installed as subsequent restarts, add `opennms-alarm-history-elastic` to the `featuresBoot` property in the `${OPENNMS_HOME}/etc/org.apache.karaf.features.cfg`.

9.8.3. Alarm indexing

When alarms are initially created, we push a document to Elasticsearch that includes all of the alarm fields as well as additional details on some of the related objects (i.e. the node.)

In order to avoid pushing a new document every time a new event is reduced on to an existing alarm, we only push a new document when (at least) one of these conditions are met:

1. We have not recently pushed a document for that alarm. (See `alarmReindexDurationMs`.)
2. The severity of the alarm has changed.
3. The alarm has been acknowledged or unacknowledged.
4. Either of the associated sticky or journal memos have changed.
5. The state of the associated ticket has changed.
6. The alarm has been associated with, or removed, from a situation.
7. A related alarm has been added or removed from the situation.

To change this behaviour and push a new document for every change, you can set `indexAllUpdates` to `true`.

When alarms are deleted, we push a new document that contains the alarm id, reduction key, and deletion time.

The following table describes a subset of the fields in the alarm document:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>@first_event_time</td>
<td>Timestamp in milliseconds associated with the first event that triggered this alarm.</td>
</tr>
<tr>
<td>@first_event_time</td>
<td>Timestamp in milliseconds associated with the last event that triggered this alarm.</td>
</tr>
<tr>
<td>@update_time</td>
<td>Timestamp in milliseconds at which the document was created.</td>
</tr>
<tr>
<td>@deleted_time</td>
<td>Timestamp in milliseconds when the alarm was deleted.</td>
</tr>
<tr>
<td>id</td>
<td>Database ID associated with the alarm.</td>
</tr>
<tr>
<td>reduction_key</td>
<td>Key used to reduce events on to the alarm.</td>
</tr>
<tr>
<td>severity_label</td>
<td>Severity of the alarm.</td>
</tr>
<tr>
<td>severity_id</td>
<td>Numerical ID used to represent the severity.</td>
</tr>
</tbody>
</table>

### 9.8.4. Options

In addition to those mentioned in Elasticsearch Integration Configuration, the following properties can be set in `${OPENNMS_HOME}/etc/org.opennms.features.alarms.history.elastic.cfg`:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Required</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>indexAllUpdates</td>
<td>Index every alarm update, including simple event reductions.</td>
<td>optional</td>
<td><code>false</code></td>
</tr>
<tr>
<td>alarmReindexDurationMs</td>
<td>Number of milliseconds to wait before re-indexing an alarm if nothing “interesting” has changed.</td>
<td>optional</td>
<td><code>36000000</code></td>
</tr>
<tr>
<td>lookbackPeriodMs</td>
<td>Number of milliseconds to go back when searching for alarms.</td>
<td>optional</td>
<td><code>604800000</code></td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
<td>Required</td>
<td>Default</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------</td>
<td>---------</td>
</tr>
<tr>
<td><code>batchIndexSize</code></td>
<td>Maximum number of records inserted in a single batch insert.</td>
<td>optional</td>
<td>200</td>
</tr>
<tr>
<td><code>bulkRetryCount</code></td>
<td>Number of retries until a bulk operation is considered failed.</td>
<td>optional</td>
<td>3</td>
</tr>
<tr>
<td><code>taskQueueCapacity</code></td>
<td>Maximum number of tasks to hold in memory.</td>
<td>optional</td>
<td>5000</td>
</tr>
</tbody>
</table>
Chapter 10. Notifications

10.1. Introduction

OpenNMS Horizon uses notifications to make users aware of an event. Common notification methods are email and paging, but notification mechanisms also exist for:

- Browser based desktop notifications
- Arbitrary HTTP GET and POST operations
- Arbitrary external commands
- Asterisk call origination
- IRCcat Internet Relay Chat bot
- SNMP Traps
- Slack, Mattermost, and other API-compatible team chat platforms
- Twitter, GNU Social, and other API-compatible microblog services
- User-provided scripts in any JSR-223 compatible language
- XMPP

The notification daemon Notifd creates and sends notifications according to configured rules when selected events occur in OpenNMS Horizon.

10.2. Getting Started

The status of notifications is indicated by an icon at the top right of the web UI's navigation bar. OpenNMS Horizon installs with notifications globally disabled by default.

10.2.1. Enabling Notifications

To enable notifications in OpenNMS Horizon, log in to the web UI as a user with administrator privileges. Hover over the user icon and click the Configure OpenNMS link. The controls for global notification status appear in the top-level configuration menu as Notification Status. Click the On radio button and then the Update button. Notifications are now globally enabled.

The web workflow above is functionally equivalent to editing the notifd-configuration.xml file and setting status="on" in the top-level notifd-configuration element. This configuration file change is picked up on the fly with no need to restart or send an event.

10.2.2. Configuring Destination Paths

To configure notification destination paths in OpenNMS Horizon, navigate to Configure OpenNMS and, in the Event Management section, choose Configure Notifications. In the resulting dialog choose Configure Destination Paths.
10.2.3. Configuring Event Notifications

To configure notifications for individual events in *OpenNMS Horizon*, navigate to Configure OpenNMS and, in the Event Management section, choose Configure Notifications. Then choose Configure Event Notifications.

The filter rule configured in notifications.xml, for ex: `<rule>IPADDR != '0.0.0.0'</rule>` is not strict by default. That means if there is any event that is not associated with any node/interface, it would not validate rule and by default notification would be saved. The rule can be changed to be strict i.e. `<rule strict="true">IPADDR != '0.0.0.0'</rule>` then the rule will always be evaluated and if there is no node/interface associated with event, notification wouldn’t be saved.

By default, OpenNMS executes the destination path of all notifications matching the event's uei. You can configure OpenNMS to only execute the destination path of the first matching notification by editing the notifd-configuration.xml file and setting `match-all="false"` in the top-level notifd-configuration element. This configuration file change is picked up on the fly with no need to restart or send an event.

10.3. Concepts

*Notifications* are how *OpenNMS Horizon* informs users about an event that happened in the network, without the users having to log in and look at the UI. The core concepts required to understand notifications are:

- Events and UEIs
- Users, Groups, and On-Call Roles
- Duty Schedules
- Destination Paths
- Notification Commands

These concepts fit together to form an *Event Notification Definition*. Also related, but presently only loosely coupled to notifications, are *Alarms* and *Acknowledgments*. 
10.3.1. Events and UEIs

As discussed in the chapter on Events, events are central to the operation of OpenNMS Horizon. Almost everything that happens in the system is the result of, or the cause of, one or more events; Every notification is triggered by exactly one event. A good understanding of events is therefore essential to a working knowledge of notifications.

Every event has a UEI (Uniform Event Identifier), a string uniquely identifying the event’s type. UEIs are typically formatted in the style of a URI, but the only requirement is that they start with the string `uei`. Most notifications are triggered by an exact UEI match (though they may also be triggered with partial UEI matches using regular expression syntax).

10.3.2. Users, Groups, and On-Call Roles

Users are entities with login accounts in the OpenNMS Horizon system. Ideally each user corresponds to a person. They are used to control access to the web UI, but also carry contact information (e-mail addresses, phone numbers, etc.) for the people they represent. A user may receive a notification either individually or as part of a Group or On-Call Role. Each user has several technology-specific contact fields, which must be filled if the user is to receive notifications by the associated method.

Groups are lists of users. In large systems with many users it is helpful to organize them into Groups. A group may receive a notification, which is often a more convenient way to operate than on individual user. Groups allow to assign a set of users to On Call Roles to build more complex notification workflows.

**How to create or modify membership of Users in a Group**

1. Login as a User with administrative permissions
2. Choose Configure OpenNMS from the user specific main navigation which is named as your login user name
3. Choose Configure Users, Groups and On-Call roles and select Configure Groups
4. Create a new Group with Add new group or modify an existing Group by clicking the Modify icon next to the Group
5. Select User from Available Users and use the >> to add them to the Currently in Group or select the users in the Currently in Group list and use << to remove them from the list.
6. Click Finish to persist and apply the changes

**The order of the Users in the group is relevant and is used as the order for Notifications when this group is used as Target in a Destination Path.**

**How to delete a Group**

1. Login as a User with administrative permissions
2. Choose Configure OpenNMS from the user specific main navigation which is named as your login user name
3. Choose Configure Users, Groups and On-Call roles and select Configure Groups
4. Use the trash bin icon next to the Group to delete

5. Confirm delete request with OK

On-Call Roles are an overlay on top of groups, designed to enable OpenNMS Horizon to target the appropriate user or users according to a calendar configuration. A common use case is to have System Engineers in On-Call rotations with a given schedule. The On-Call Roles allow to assign a predefined Duty Schedule to an existing Group with Users. For each On-Call Role a User is assigned as a Supervisor to be responsible for the group of people in this On-Call Role.

How to assign a Group to an On-Call Role

1. Login as a User with administrative permissions

2. Choose Configure OpenNMS from the user specific main navigation which is named as your login user name

3. Choose Configure Users, Groups and On-Call roles and select Configure On-Call Roles

4. Use Add New On-Call Role and set a Name for this On-Call Role, assign an existing Group and give a meaningful description

5. Click Save to persist

6. Define a Duty Schedule in the calendar for the given date by click on the Plus (+) icon of the day and provide a notification time for a specific User from the associated Group

7. Click Save to persist the Schedule

8. Click Done to apply the changes

10.3.3. Duty Schedules

Every User and Group may have a Duty Schedule, which specifies that user’s (or group’s) weekly schedule for receiving notifications. If a notification should be delivered to an individual user, but that user is not on duty at the time, the notification will never be delivered to that user. In the case of notifications targeting a user via a group, the logic differs slightly. If the group is on duty at the time the notification is created, then all users who are also on duty will be notified. If the group is on duty, but no member user is currently on duty, then the notification will be queued and sent to the next user who comes on duty. If the group is off duty at the time the notification is created, then the notification will never be sent.

10.3.4. Destination Paths

A Destination Path is a named, reusable set of rules for sending notifications. Every destination path has an initial step and zero or more escalation steps.

Each step in a destination path has an associated delay which defaults to zero seconds. The initial step’s delay is called the initial delay, while an escalation step’s delay is simply called its delay.

Each step has one or more targets. A target may be a user, a group, an on-call role, or a one-off e-mail address.
While it may be tempting to use one-off e-mail addresses any time an individual user is to be targeted, it's a good idea to reserve one-off e-mail addresses for special cases. If a user changes her e-mail address, for instance, you'll need to update in every destination path where it appears. The use of one-off e-mail addresses is meant for situations where a vendor or other external entity is assisting with troubleshooting in the short term.

When a step targets one or more groups, a delay may also be specified for each group. The default is zero seconds, in which case all group members are notified simultaneously. If a longer delay is set, the group members will be notified in alphabetical order of their usernames.

Avoid using the same name for a group and a user. The destination path configuration does not distinguish between users and groups at the step level, so the behavior is undefined if you have both a user and a group named admin. It is for this reason that the default administrators group is called Admin (with a capital A) — case matters.

Within a step, each target is associated with one or more notification commands. If multiple commands are selected, they will execute simultaneously.

Each step also has an auto-notify switch, which may be set to off, on, or auto. This switch specifies the logic used when deciding whether or not to send a notice for an auto-acknowledged notification to a target that was not on duty at the time the notification was first created. If off, notices will never be sent to such a target; if on, they will always be sent; if auto, the system employs heuristics aimed at "doing the right thing".

### 10.3.5. Notification Commands

A Notification Command is a named, reusable execution profile for a Java class or external program command used to convey notices to targets. The following notification commands are included in the default configuration:

- **callHomePhone, callMobilePhone, and callWorkPhone**
  
  Ring one of the phone numbers configured in the user's contact information. All three are implemented using the in-process Asterisk notification strategy, and differ only in which contact field is used.

- **ircCat**
  
  Conveys a notice to an instance of the IRCcat Internet Relay Chat bot. Implemented by the in-process IRCcat notification strategy.

- **javaEmail and javaPagerEmail**
  
  By far the most commonly used commands, these deliver a notice to a user's email or pagerEmail contact field value. By configuring a user's pagerEmail contact field value to target an email-to-SMS gateway, SMS notifications are trivially easy to configure. Both are implemented using the in-process JavaMail notification strategy.
microblogDM, microblogReply, and microblogUpdate

Sends a notice to a user as a direct message, at a user via an at-reply, or to everybody as an update via a microblog service with a Twitter v1-compatible API. Each command is implemented with a separate, in-process notification strategy.

numericPage and textPage

Sends a notice to a user's numeric or alphanumeric pager. Implemented as an external command using the qpage utility.

xmppGroupMessage and xmppMessage

Sends a message to an XMPP group or user. Implemented with the in-process XMPP notification strategy.

Notification commands are customizable and extensible by editing the notificationCommands.xml file.

Use external binary notification commands sparingly to avoid fork-bombing your OpenNMS Horizon system. Originally, all notification commands were external. Today only the numericPage and textPage commands use external programs to do their work.

10.4. Bonus Notification Methods

A handful of newer notification methods are included in OpenNMS Horizon but currently require manual steps to activate.

10.4.1. Mattermost

If your organization uses the Mattermost team communications platform, you can configure OpenNMS Horizon to send notices to any Mattermost channel via an incoming webhook. You must configure an incoming webhook in your Mattermost team and do a bit of manual configuration to your OpenNMS Horizon instance.

First, add the following bit of XML to the notificationCommands.xml configuration file (no customization should be needed):
Then create a new file called `mattermost.properties` in the `opennms.properties.d` directory with the following contents (customizing values as appropriate):

```properties
org.opennms.netmgt.notifd.mattermost.webhookURL=https://mattermost.example.com/hooks/bf980352b5f7232efe721dbf0626bee1
```

Restart OpenNMS so that the `mattermost.properties` file will be loaded. Your new `mattermost` notification command is now available for use in a destination path.

**Additional Options**

The following table lists optional properties that you may use in `mattermost.properties` to customize your Mattermost notifications.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>channel</td>
<td>Specify a channel or private group other than the one targeted by the webhook</td>
<td>optional</td>
<td>Webhook default</td>
<td>NetOps</td>
</tr>
<tr>
<td>username</td>
<td>The username to associate with the notification posts</td>
<td>optional</td>
<td>None</td>
<td>OpenNMS_Bot</td>
</tr>
<tr>
<td>iconEmoji</td>
<td>An emoji sequence to use as the icon for the notification posts</td>
<td>optional</td>
<td>No icon</td>
<td>:metal:</td>
</tr>
<tr>
<td>iconURL</td>
<td>The URL of an image to use as the icon for the notification posts</td>
<td>optional</td>
<td>No icon</td>
<td><a href="https://example.org/assets/icon.png">https://example.org/assets/icon.png</a></td>
</tr>
</tbody>
</table>

To improve the layout, the property names have been shortened to their final component; you must prepend `org.opennms.netmgt.notifd.mattermost.` when using them.
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>useSystemProxy</td>
<td>Should the system wide proxy settings be used? The system proxy settings can be configured via system properties</td>
<td>optional</td>
<td>true</td>
<td>true</td>
</tr>
</tbody>
</table>

Some of the optional configuration parameters are incompatible with some versions of Mattermost. For instance, the `channel` option is known not to work with Mattermost 3.7.0.

For more information on incoming webhooks in Mattermost, see [Mattermost Integration Guide](#).

### 10.4.2. Slack Notifications

If your organization uses the Slack team communications platform, you can configure *OpenNMS Horizon* to send notices to any Slack channel via an incoming webhook. You must configure an incoming webhook in your Slack team and do a bit of manual configuration to your *OpenNMS Horizon* instance.

First, add the following bit of XML to the `notificationCommands.xml` configuration file (no customization should be needed):

```xml
<command binary="false">
  <name>slack</name>
  <execute>org.opennms.netmgt.notifd.SlackNotificationStrategy</execute>
  <comment>class for sending messages to a Slack team channel for notifications</comment>
  <argument streamed="false">
    <switch>-subject</switch>
  </argument>
  <argument streamed="false">
    <switch>-tm</switch>
  </argument>
</command>
```

Then create a new file called `slack.properties` in the `opennms.properties.d` directory with the following contents (customizing values as appropriate):

```properties
org.opennms.netmgt.notifd.slack.webhookURL=https://hooks.slack.com/services/AEJ7IIYAI/XOOTH3EOD/c3fc4a662c8e07fd07e072aeeec
```

Restart OpenNMS so that the `slack.properties` file will be loaded. Your new `slack` notification command is now available for use in a destination path.
Additional Options

The following table lists optional properties that you may use in `slack.properties` to customize your Slack notifications.

To improve the layout, the property names have been shortened to their final component; you must prepend `org.opennms.netmgt.notifd.slack.` when using them.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>channel</td>
<td>Specify a channel or private group other than the one targeted by the webhook</td>
<td>optional</td>
<td>Webhook default</td>
<td>NetOps</td>
</tr>
<tr>
<td>username</td>
<td>The username to associate with the notification posts</td>
<td>optional</td>
<td>None</td>
<td>OpenNMS_Bot</td>
</tr>
<tr>
<td>iconEmoji</td>
<td>An emoji sequence to use as the icon for the notification posts</td>
<td>optional</td>
<td>No icon</td>
<td>:metal:</td>
</tr>
<tr>
<td>iconURL</td>
<td>The URL of an image to use as the icon for the notification posts</td>
<td>optional</td>
<td>No icon</td>
<td><a href="https://example.org/assets/icon.png">https://example.org/assets/icon.png</a></td>
</tr>
<tr>
<td>useSystemProxy</td>
<td>Should the system wide proxy settings be used? The system proxy settings can be configured via system properties</td>
<td>optional</td>
<td>true</td>
<td>true</td>
</tr>
</tbody>
</table>

For more information on incoming webhooks in Slack, see Slack API.
Chapter 11. Provisioning

11.1. Introduction

The introduction of OpenNMS version 1.8 empowers enterprises and services providers like never before with a new service daemon for maintaining the managed entity inventory in OpenNMS. This new daemon, Provisiond, unifies all previous entity control mechanisms available in 1.6 (Capsd and the Importer), into a new and improved, massively parallel, policy based provisioning system. System integrators should note, Provisiond comes complete with a RESTful Web Service API for easy integration with external systems such as CRM or external inventory systems as well as an adapter API for interfacing with other management systems such as configuration management.

OpenNMS 1.0, introduced almost a decade ago now, provided a capabilities scanning daemon, Capsd, as the mechanism for provisioning managed entities. Capsd, deprecated with the release of 1.8.0, provided a rich automatic provisioning mechanism that simply required an IP address to seed its algorithm for creating and maintaining the managed entities (nodes, interfaces, and IP based services). Version 1.2 added and XML-RPC API as a more controlled (directed) strategy for provisioning services that was mainly used by non telco based service providers (i.e. managed hosting companies). Version 1.6 followed this up with yet another and more advanced mechanism called the Importer service daemon. The Importer provided large service providers with the ability to strictly control the OpenNMS entity provisioning with an XML based API for completely defining and controlling the entities where no discovery and service scanning scanning was feasible.

The Importer service improved OpenNMS' scalability for maintaining managed entity databases by an order of magnitude. This daemon, while very simple in concept and yet extremely powerful and flexible provisioning improvement, has blazed the trail for Provisiond. The Importer service has been in production for 3 years in service provider networks maintaining entity counts of more than 50,000 node level entities on a single instances of OpenNMS. It is a rock solid provisioning tool.

Provisiond begins a new era of managed entity provisioning in OpenNMS.

11.2. Concepts

Provisioning is a term that is familiar to service providers (a.k.a. operators, a.k.a. telephone companies) and OSS systems but not so much in the non OSS enterprises.

Provisiond receives "requests" for adding managed entities via 2 basic mechanisms, the OpenNMS Horizon traditional "New Suspect" event, typically via the Discovery daemon, and the import requisition (XML definition of node entities) typically via the Provisioning Groups UI. If you are familiar with all previous releases of OpenNMS, you will recognize the New Suspect Event based Discovery to be what was previously the Capsd component of the auto discovery behavior. You will also recognize the import requisition to be of the Model Importer component of OpenNMS. Provisiond now unifies these two separate components into a massively parallel advanced policy based provisioning service.
11.2.1. Terminology

The following terms are used with respect to the OpenNMS Horizon provisioning system and are essential for understanding the material presented in this guide.

Entity

Entities are managed objects in OpenNMS Horizon such as Nodes, IP interfaces, SNMP Interfaces, and Services.

Foreign Source and Foreign ID

The Importer service from 1.6 introduced the idea of foreign sources and foreign IDs. The Foreign Source uniquely identifies a provisioning source and is still a basic attribute of importing node entities into OpenNMS Horizon. The concept is to provide an external (foreign) system with a way to uniquely identify itself and any node entities that it is requesting (via a requisition) to be provisioned into OpenNMS Horizon.

The Foreign ID is the unique node ID maintained in foreign system and the foreign source uniquely identifies the external system in OpenNMS Horizon.

OpenNMS Horizon uses the combination of the foreign source and foreign ID become the unique foreign key when synchronizing the set of nodes from each source with the nodes in the OpenNMS Horizon DB. This way the foreign system doesn’t have to keep track of the OpenNMS Horizon node IDs that are assigned when a node is first created. This is how Provisiond can decided if a node entity from an import requisition is new, has been changed, or needs to be deleted.

Foreign Source Definition

Additionally, the foreign source has been extended to also contain specifications for how entities should be discovered and managed on the nodes from each foreign source. The name of the foreign source has become pervasive within the provisioning system and is used to simply some of the complexities by weaving this name into:

- the name of the provisioning group in the Web-UI
- the name of the file containing the persisted requisition (as well as the pending requisition if it is in this state)
- the foreign-source attribute value inside the requisition (obviously, but, this is pointed out to indicate that the file name doesn’t necessarily have to equal the value of this attribute but is highly recommended as an OpenNMS Horizon best practice)
- the building attribute of the node defined in the requisition (this value is called “site” in the Web-UI and is assigned to the building column of the node’s asset record by Provisiond and is the default value used in the Site Status View feature)

Import Requisition

Import requisition is the terminology OpenNMS Horizon uses to represent the set of nodes, specified in XML, to be provisioned from a foreign source into OpenNMS Horizon. The requisition schema (XSD) can be found at the following location. [http://xmlns.opennms.org/xsd/config/model-274](http://xmlns.opennms.org/xsd/config/model-274)
Auto Discovery

Auto discovery is the term used by OpenNMS Horizon to characterize the automatic provisioning of nodes entities. Currently, OpenNMS Horizon uses an ICMP ping sweep to find IP address on the network. **Auto-discovery-with-detectors** will allow defining specific detectors for auto discovery to succeed. For the IPs that succeed and that are not currently in the DB, OpenNMS Horizon generates a new suspect event. When this event is received by Provisiond, it creates a node and it begins a node scan based on the default foreign source definition.

Directed Discovery

Provisiond takes over for the Model Importer found in version 1.6 which implemented a unique, first of its kind, controlled mechanism for specifying managed entities directly into OpenNMS Horizon from one or more data sources. These data sources often were in the form of an in-house developed inventory or stand-alone provisioning system or even a set of element management systems. Using this mechanism, OpenNMS Horizon is directed to add, update, or delete a node entity exactly as defined by the external source. No discovery process is used for finding more interfaces or services.

Enhanced Directed Discovery

Directed discovery is enhanced with the capability to scan nodes that have been directed nodes for entities (interfaces).

Policy-Based Discovery

The phrase policy-based directed discovery, is a term that represents the latest step in OpenNMS Horizon provisioning evolution and best describes the new provisioning architecture now in OpenNMS Horizon for maintaining its inventory of managed entities. This term describes the control that is given over the Provisioning system to OpenNMS Horizon users for managing the behavior of the NMS with respect to the new entities that are being discovered. Current behaviors include persistence, data collection, service monitoring, and categorization policies.

11.2.2. Addressing Scalability

The explosive growth and density of the IT systems being deployed today to support not traditional IP services is impacting management systems like never before and is demanding from them tremendous amounts of scalability. The scalability of a management system is defined by its capacity for maintaining large numbers of managing entities coupled with its efficiency of managing the entities.

Today, it is not uncommon for OpenNMS Horizon deployments to find node entities with tens of thousands of physical interfaces being reported by SNMP agents due to virtualization (virtual hosts, interfaces, as well as networks). An NMS must be capable of using the full capacity every resource of its computing platform (hardware and OS) as effectively as possible in order to manage these environments. The days of writing scripts or single threaded applications will just no longer be able to do the work required an NMS when dealing with the scalability challenges facing systems and...
systems administrators working in this domain.

**Parallelization and Non-Blocking I/O**

Squeezing out every ounce of power from a management system’s platform (hardware and OS) is absolutely required to complete all the work of a fully functional NMS such as OpenNMS Horizon. Fortunately, the hardware and CPU architecture of a modern computing platform provides multiple CPUs with multiple cores having instruction sets that include support for atomic operations. While these very powerful resources are being provided by commodity systems, it makes the complexity of developing applications to use them vs. not using them, orders of magnitude more complex. However, because of scalability demands of our complex IT environments, multi-threaded NMS applications are now essential and this has fully exposed the complex issues of concurrency in software development.

OpenNMS Horizon has stepped up to this challenge with its new concurrency strategy. This strategy is based on a technique that combines the efficiency of parallel (asynchronous) operations (traditionally used by most effectively by single threaded applications) with the power of a fully current, non-blocking, multi-threaded design. The non-blocking component of this new concurrency strategy added greater complexity but OpenNMS Horizon gained orders of magnitude in increased scalability.

| Java Runtimes, based on the Sun JVM, have provided implementations for processor based atomic operations and is the basis for OpenNMS Horizon' non-blocking concurrency algorithms. |

**Provisioning Policies**

Just because you can, doesn’t mean you should! Because the massively parallel operations being created for *Provisiond* allows tremendous numbers of nodes, interfaces, and services to be very rapidly discovered and persisted, doesn’t mean it should. A *policy API* was created for *Provisiond* that allows implementations to be developed that can be applied to control the behavior of *Provisiond*. The 1.8 release includes a set of flexible provisioning policies that control the persistence of entities and their attributes constrain monitoring behavior.

When nodes are imported or re-scanned, there is, potentially, a set of zero or more provisioning policies that are applied. The policies are defined in the foreign source's definition. The policies for an auto-discovered node or nodes from provisioning groups that don’t have a foreign source definition, are the policies defined in the default foreign source definition.

**The Default Foreign Source Definition**

Contained in the libraries of the Provisioning service is the "template" or default foreign source. The template stored in the library is used until the OpenNMS Horizon admin user alters the default from the *Provisioning Groups* WebUI. Upon edit, this template is exported to the OpenNMS Horizon *etc/* directory with the file name: *default-foreign-source.xml*. 

276
Automatic Rescanning

The default foreign source defines a scan-interval of 1d, which will cause all nodes in the requisition to be scanned daily. You may set the scan interval using any combination of the following signifiers:

- w: Weeks
- d: Days
- h: Hours
- m: Minutes
- s: Seconds
• ms: Milliseconds

For example, to rescan every 6 days and 53 minutes, you would set the `scan-interval` to `6d 53m`.

Don’t forget, for the new scan interval to take effect, you will need to import the requisition one more time so that the foreign source becomes active.

Disabling Rescan

For a large number of devices, you may want to set the `scan-interval` to `0` to disable automatic rescan altogether. OpenNMS Horizon will not attempt to rescan the nodes in the requisition unless you trigger a manual (forced) rescan through the web UI or Provisioning ReST API.

### 11.3. Getting Started

An NMS is of no use until it is setup for monitoring and entities are added to the system. OpenNMS Horizon installs with a base configuration with a configuration that is sufficient get service level monitoring and performance management quickly up and running. As soon as managed entities are provisioned, the base configuration will automatically begin monitoring and reporting.

Generally speaking, there are two methods of provisioning in OpenNMS Horizon: *Auto Discovery* and *Directed Discovery*. We’ll start with *Auto Discovery*, but first, we should quickly review the configuration of SNMP so that newly discovered devices can be immediately scanned for entities as well as have reporting and thresholding available.

#### 11.3.1. Provisioning the SNMP Configuration

OpenNMS Horizon requires SNMP configuration to be properly setup for your network in order to properly understand Network and Node topology as well as to automatically enable performance data collection. Network topology is updated as nodes (a.k.a. devices or hosts) are provisioned. Navigate to the *Admin/Configure SNMP Community Names by IP address* as shown below.

*Configuring SNMP community names*
Provisiond includes an option to add community information in the Single Node provisioning interface. This is equivalent of entering a single IP address in the screen with the convenience of setting the community string at the same time a node is provisioned. See the Quick Node Add feature below for more details about this capability.

This screen sets up SNMP within OpenNMS Horizon for agents listening on IP addresses 10.1.1.1 through 10.254.254.254. These settings are optimized into the snmp-configuration.xml file. Optimization means that the minimal configuration possible will be written. Any IP addresses already configured that are eclipsed by this range will be removed. Here is the resulting configuration.

**Sample snmp-config.xml**

```xml
<?xml version="1.0" encoding="UTF-8"?>

<snmp-config
    xmlns="http://xmlns.opennms.org/xsd/config/snmp[http://xmlns.opennms.org/xsd/config/snmp]
    port="161" retry="3" timeout="800" read-community="public"

    version="v1" max-vars-per-pdu="10">
     <definition retry="1" timeout="2000"

    read-community="public" version="v2c">

    <specific>10.12.23.32</specific>

    </definition>

</snmp-config>
```

However, if an IP address is then configured that is within the range, the range will be split into two separate ranges and a specific entry will be added. For example, if a configuration was added through the same UI for the IP: 10.12.23.32 having the community name public, then the resulting configuration will be:
Now, with SNMP configuration provisioned for our 10 networks, we are ready to begin adding nodes. Our first example will be to automatically discover and add all managed entities (nodes, IP interfaces, SNMP Interfaces, and Monitored IP based Services). We will then give an example of how to be more directed and deliberate about your discovery by using Provisioning Groups.

Automatically discovered entities are analyzed, persisted to the relational data store, and then managed based on the policies defined in the default foreign source definition. This is very similar to the way that entities were previously handled by the (now obsolete) Capsd daemon but with finer grained sense of control.

11.3.2. Automatic Discovery

Currently in OpenNMS Horizon, the ICMP is used to automatically provision node entities into OpenNMS Horizon. This functionality has been in OpenNMS since its 1.0 release, however, in 1.8, a few of the use cases have been updated with Provisiond’s replacement of Capsd.

Separation of Concerns

Version 1.8 Provisiond separates what was called Capsd scanning in to 3 distinct phases: entity scanning, service detection, and node merging. These phases are now managed separately by Provisiond. Immediately following the import of a node entity, tasks are created for scanning a node to discover the node entity’s interfaces (SNMP and IP). As interfaces are found, they are persisted and tasks are scheduled for service detection of each IP interface.

For auto discovered nodes, a node merging phase is scheduled; Nodes that have been directly provisioned will not be included in the node merging process. Merging will only occur when 2
automatically discovered nodes appear to be the same node.

the use case and redesign of node merging is still an outstanding issue with the 1.8.0 release

11.3.3. Enhanced Directed Discovery

This new form of provisioning first appears in OpenNMS with version 1.8 and the new Provisiond service. It combines the benefits of the Importer’s strictly controlled methodology of directed provisioning (from version 1.6) with OpenNMS’ robustly flexible auto discovery. Enhanced Directed discovery begins with an enhanced version of the same import requisition used in directed provisioning and completes with a policy influenced persistence phase that sorts though the details of all the entities and services found during the entity and service scanning phase.

If you are planning to use this form of provisioning, it important to understand the conceptual details of how Provisiond manages entities it is directed to provision. This knowledge will enable administrators and systems integrators to better plan, implement, and resolve any issues involved with this provisioning strategy.

Understanding the Process

There are 3 phases involved with directing entities to be discovered: import, node scan, and service scan. The import phase also has sub phases: marshal, audit, limited SNMP scan, and re-parent.

Marshal and Audit Phases

It is important to understand that the nodes requisitioned from each foreign source are managed as a complete set. Nodes defined in a requisition from the foreign source CRM and CMDB, for example, will be managed separately from each other even if they should contain exactly the same node definitions. To OpenNMS Horizon, these are individual entities and they are managed as a set.

Requisitions are referenced via a URL. Currently, the URL can be specified as one of the following protocols: FILE, HTTP, HTTPS, and DNS. Each protocol has a protocol handler that is used to stream the XML from a foreign source, i.e. http://inv.corp.org/import.cgi?customer=acme or file:/opt/opennms/etc/imports/acme.xml. The DNS protocol is a special handler developed for Provisioning sets of nodes as a foreign-source from a corporate DNS server. See DNS Protocol Handler for details.

Upon the import request (either on schedule or on demand via an Event) the requisition is marshaled into Java objects for processing. The nodes defined in the requisition represent what OpenNMS Horizon should have as the current set of managed entities from that foreign source. The audit phase determines for each node defined (or not defined) in the requisition set with the set of foreign IDs of currently managed entities in OpenNMS Horizon.

The intersection of the IDs from each set will become the Update operations, the extra set of foreign IDs that are in the requisition become the Add operations, and the extra set of foreign IDs from the managed entities become the Delete operations. This implies that the foreign IDs from each foreign
source must be unique.

Naturally, the first time an import request is processed from a foreign source there will be zero (0) node entities from the set of nodes currently being managed and each node defined in the requisition will become an Add Operation. If a requisition is processed with zero (0) node definitions, all the currently managed nodes from that foreign source will become Delete operations (all the nodes, interfaces, outages, alarms, etc. will be removed from OpenNMS Horizon).

When nodes are provisioned using the Provisioning Groups Web-UI, the requisitions are stored on the local file system and the file protocol handler is used to reference the requisition. Each Provisioning Group is a separate foreign source and unique foreign IDs are generated by the Web-UI. An MSP might use Provisioning Groups to define the set of nodes to be managed by customer name where each customer’s set of nodes are maintained in a separate Provisioning Group.

Import Phase

The import phase begins when Provisiond receives a request to import a requisition from a URL. The first step in this phase is to load the requisition and marshal all the node entities defined in the requisition into Java objects.

If any syntactical or XML structural problems occur in the requisition, the entire import is abandoned and no import operations are completed.

Once the requisition is marshaled, the requisition nodes are audited against the persisted node entities. The set of requisitioned nodes are compared with a subset of persisted nodes and this subset is generated from a database query using the foreign source defined in the requisition. The audit generates one of three operations for each requisition node: insert, update, delete based on each requisitioned node’s foreign ID. Delete operations are created for any nodes that are not in the requisition but are in the DB subset, update operations are created for requisition nodes that match a persisted node from the subset (the intersection), and insert operations are created from the remaining requisition nodes (nodes in the requisition that are not in the DB subset).

If a requisition node has an interface defined as the Primary SNMP interface, then during the update and insert operations the node will be scanned for minimal SNMP attribute information. This scan find the required node and SNMP interface details required for complete SNMP support of the node and only the IP interfaces defined in the requisition.

this not the same as Provisiond SNMP discovery scan phases: node scan and interface scan.

Node Scan Phase

Where directed discovery leaves off and enhanced directed discovery begins is that after all the operations have completed, directed discovery is finished and enhanced directed discovery takes off. The requisitioned nodes are scheduled for node scans where details about the node are discovered and interfaces that were not directly provisioned are also discovered. All physical (SNMP) and logical (IP) interfaces are discovered and persisted based on any Provisioning Policies that may have been defined for the foreign source associated with the import requisition.
Service Scan (detection) Phase

Additionally, the new Provisiond enhanced directed discovery mechanism follows interface discovery with service detection on each IP interface entity. This is very similar to the Capsd plugin scanning found in all former releases of OpenNMS except that the foreign source definition is used to define what services should be detected on these interfaces found for nodes in the import requisition.

11.4. Import Handlers

The new Provisioning service in OpenNMS Horizon is continuously improving and adapting to the needs of the community.

One of the most recent enhancements to the system is built upon the very flexible and extensible API of referencing an import requisition’s location via a URL. Most commonly, these URLs are files on the file system (i.e. `file:/opt/opennms/etc/imports/<my-provisioning-group.xml>`) as requisitions created by the Provisioning Groups UI. However, these same requisitions for adding, updating, and deleting nodes (based on the original model importer) can also come from URLs. For example a requisition can be retrieving the using HTTP protocol: `http://myinventory.server.org/nodes.cgi`

In addition to the standard protocols supported by Java, we provide a series of custom URL handlers to help retrieve requisitions from external sources.

11.4.1. Generic Handler

The generic handler is made available using URLs of the form: `requisition://type?param=1;param=2`

Using these URLs various type handlers can be invoked, both locally and via a Minion.

In addition to the type specific parameters, the following parameters are supported:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>The name of location at which the handler should be run</td>
<td>optional</td>
<td>Default</td>
</tr>
<tr>
<td>ttl</td>
<td>The maximum number of miliseconds to wait for the handler when ran remotely</td>
<td>optional</td>
<td>20000</td>
</tr>
</tbody>
</table>

See the relevant sections bellow for additional details on the support types.

The `opennms:show-import` command available via the Karaf Shell can be used to show the results of an import (without persisting or triggering the import):

```
opennms:show-import -l MINION http url=http://127.0.0.1:8000/req.xml
```
11.4.2. File Handler

Examples:

Simple

file:///path/to/my/requisition.xml

Using the generic handler

requisition://file?path=/path/to/my/requisition.xml;location=MINION

11.4.3. HTTP Handler

Examples:

Simple

http://myinventory.server.org/nodes.cgi

Using the generic handler

When using the generic handler, the URL should be "URL encoded".

11.4.4. DNS Handler

The DNS handler requests a Zone Transfer (AXFR) request from a DNS server. The A records are recorded and used to build an import requisition. This is handy for organizations that use DNS (possibly coupled with an IP management tool) as the data base of record for nodes in the network. So, rather than ping sweeping the network or entering the nodes manually into OpenNMS Horizon Provisioning UI, nodes can be managed via 1 or more DNS servers.

The format of the URL for this new protocol handler is: dns://<host>[:port]/<zone>[/<foreign-source>/][?expression=<regex>]

DNS Import Examples:

Simple

dns://my-dns-server/myzone.com

This URL will import all A records from the host my-dns-server on port 53 (default port) from zone "myzone.com" and since the foreign source (a.k.a. the provisioning group) is not specified it will default to the specified zone.
Using a Regular Expression Filter

dns://my-dns-server/myzone.com/portland/?expression=^por-.*

This URL will import all nodes from the same server and zone but will only manage the nodes in the zone matching the regular expression `^por-.*` and will and they will be assigned a unique foreign source (provisioning group) for managing these nodes as a subset of nodes from within the specified zone.

If your expression requires URL encoding (for example you need to use a `?` in the expression) it must be properly encoded.

dns://my-dns-server/myzone.com/portland/?expression=^por[0-9]%3F

You can use the `location` parameter to assign a single location to all nodes in this requisition:

dns://my-dns-server/myzone.com/portland/?location=Raleigh

By preceding a `~` you can specify a properly encoded regular expression to determine the location based on the host entries. In the following, for example, we want to derive the location based on the subdomain. We use the regular expression `^(?:\.|)\.(.?)\.hs-fulda\.de\.$` with exactly one capturing group:

dns://my-dns-server/hs-fulda.de/?location=~%5E%28%3F%3A%2A%5C.%7C%29%28%.%3F%29%5C.hs-fulda%5C.de%5C.%24

This will associate nodes for the host entries `foo.e46.hs-fulda.de`. and `bar.e46.hs-fulda.de.` to the location `e46` while hosts like `aaa.g51.hs-fulda.de` and `bbb.g51.hs-fulda.de` will be assigned location `g51`.

💡 You can use online tools like [https://www.urlencoder.org](https://www.urlencoder.org) to en- and decode your parameters.

DNS Setup

Currently, the DNS server requires to be setup to allow a zone transfer from the OpenNMS Horizon server. It is recommended that a secondary DNS server is running on OpenNMS Horizon and that the OpenNMS Horizon server be allowed to request a zone transfer. A quick way to test if zone transfers are working is:

dig -t AXFR @<dnsServer> <zone>

Configuration

The configuration of the Provisioning system has moved from a properties file (`model-importer.properties`) to an XML based configuration container. The configuration is now extensible
to allow the definition of 0 or more import requisitions each with their own cron based schedule for automatic importing from various sources (intended for integration with external URL such as http and this new dns protocol handler.

A default configuration is provided in the OpenNMS Horizon etc/ directory and is called: provisiond-configuration.xml. This default configuration has an example for scheduling an import from a DNS server running on the localhost requesting nodes from the zone, localhost and will be imported once per day at the stroke of midnight. Not very practical but is a good example.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<provisiond-configuration xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://xmlns.opennms.org/xsd/config/provisiond-configuration"
foreign-source-dir="/opt/opennms/etc/foreign-sources"
requisition-dir="/opt/opennms/etc/imports"
importThreads="8"
scanThreads="10"
rescanThreads="10"
writeThreads="8">
  <!--http://www.quartz-scheduler.org/documentation/quartz-1.x/tutorials/crontrigger
  Field Name Allowed Values Allowed Special Characters
  Seconds 0-59 , - * / Minutes 0-59 , - * / Hours 0-23 , - * /
  Day-of-month1-31, - * ? / L W C Month1-12 or JAN-DEC, - * /
  Day-of-Week1-7 or SUN-SAT, - * ? / L C # Year (Opt)empty, 1970-2099, - * /
  -->
  <requisition-def import-name="localhost"
import-url-resource="dns://localhost/localhost">
    <cron-schedule>0 0 0 * * ? *</cron-schedule> <!-- daily, at midnight -->
  </requisition-def>
</provisiond-configuration>
```

**Configuration Reload**
Like many of the daemon configuration in the 1.7 branch, the configurations are reloadable without having to restart OpenNMS Horizon, using the reloadDaemonConfig uei:

```
/opt/opennms/bin/send-event.pl
uei.opennms.org/internal/reloadDaemonConfig --parm 'daemonName Provisiond'
```

This means that you don’t have to restart OpenNMS Horizon every time you update the configuration.

**11.5. Provisioning Examples**

Here are a few practical examples of enhanced directed discovery to help with your understanding of this feature.
11.5.1. Basic Provisioning

This example adds three nodes and requires no OpenNMS Horizon configuration other than specifying the node entities to be provisioned and managed in OpenNMS Horizon.

Defining the Nodes via the Web-UI

Using the Provisioning Groups Web-UI, three nodes are created given a single IP address. Navigate to the Admin Menu and click Provisioning Groups Menu from the list of Admin options and create the group Bronze.

Creating a new Provisioning Group

[Image of the Provisioning Groups Web-UI]

Clicking the Add New Group button will create the group and will redisplay the page including this new group among the list of any group(s) that have already been created.

[Image of the Bronze Provisioning Group]

At this point, the XML structure for holding the new provisioning group (a.k.a. an import requisition) has been persisted to the '$OPENNMS_ETC/imports/pending' directory.

Clicking the Edit link will bring you to the screen where you can begin the process of defining node entities that will be imported into OpenNMS Horizon. Click the Add Node button will begin the node entity creation process fill in the node label and click the Save button.

Creating a new Node definition in the Provisioning Group

[Image of the Add Node screen]
At this point, the provisioning group contains the basic structure of a node entity but it is not complete until the interface(s) and interface service(s) have been defined. After having clicked the Save button, as we did above presents, in the Web-UI, the options Add Interface, Add Node Category, and Add Node Asset. Click the Add Interface link to add an interface entity to the node.

**Adding an Interface to the node definition**

Enter the IP address for this interface entity, a description, and specify the Primary attribute as P (Primary), S (Secondary), N (Not collected), or C (Collected) and click the save button. Now the node entity has an interface for which services can be defined for which the Web-UI now presents the Add Service link. Add two services (ICMP, SNMP) via this link.

**A complete node definition with all required elements defined.**

Now the node entity definition contains all the required elements necessary for importing this requisition into OpenNMS Horizon. At this point, all the interfaces that are required for the node should be added. For example, NAT interfaces should be specified there are services that they provide because they will not be discovered during the Scan Phase.

Two more node definitions will be added for the benefit of this example.

**The completed requisition for the example Bronze Provisioning Group**

This set of nodes represents an import requisition for the Bronze provisioning group. As this requisition is being edited via the WebUI, changes are being persisted into the OpenNMS Horizon configuration directory `$OPENNMS_etc/imports/` pending as an XML file having the name `bronze.xml`. 
The name of the XML file containing the import requisition is the same as the provisioning group name. Therefore naming your provisioning group without the use of spaces makes them easier to manage on the file system.

Click the **Done** button to return to the *Provisioning Groups* list screen. The details of the “Bronze” group now indicates that there are 3 nodes in the requisition and that there are no nodes in the DB from this group (a.k.a. foreign source). Additionally, you can see that time the requisition was last modified and the time it last imported are given (the time stamps are stored as attributes inside the requisition and are not the file system time stamps). These details are indicative of how well the DB represents what is in the requisition.

You can tell that this is a pending requisition for 2 reasons: 1) there are 3 nodes defined and 0 nodes in the DB, 2) the requisition has been modified since the last import (in this case *never*).

**Import the Nodes**

In this example, you see that there are 3 nodes in the pending requisition and 0 in the DB. Click the **Import** button to submit the requisition to the provisioning system (what actually happens is that the Web-UI sends an event to the Provisioner telling it to begin the Import Phase for this group).

Do not refresh this page to check the values of these details. To refresh the details to verify the import, click the **Provisioning Groups** bread crumb item.

You should be able to immediately verify the importation of this provisioning group because the import happens very quickly. Advantageous has several threads ready for processing the import operations of the nodes defined in this requisition.

A few SNMP packets are sent and received to get the SNMP details of the node and the interfaces defined in the requisition. Upon receipt of these packets (or not) each node is inserted as a DB transaction.

*The nodes are now added to OpenNMS Horizon and are under management.*
Following the import of a node with thousands of interfaces, you will be able to refresh the Interface table browser on the Node page and see that interfaces and services are being discovered and added in the background. This is the discovery component of directed discovery.

Adding a Node

To direct that another node be added from a foreign source (in this example the Bronze Provisioning Group) simply add a new node definition and re-import. It is important to remember that all the node definitions will be re-imported and the existing managed nodes will be updated, if necessary.

Changing a Node

To direct changes to an existing node, simply add, change, or delete elements or attributes of the node definition and re-import. This is a great feature of having directed specific elements of a node in the requisition because that attributes will simply be changed. For example, to change the IP address of the Primary SNMP interface for the node, barbrady.opennms.org, just change the requisition and re-import.

Each element in the Web-UI has an associated Edit icon Click this icon to change the IP address for barbrady.opennms.org, click save, and then Click the Done button.

Changing the IP address of barbrady.opennms.org from 10.1.1.2 to 192.168.1.1

The Web-UI will return you to the Provisioning Groups screen where you will see that there are the time stamp showing that the requisition’s last modification is more recent that the last import time.

The Provisioning Group must be re-imported

This provides an indication that the group must be re-imported for the changes made to the
requisition to take effect. The IP Interface will be simply updated and all the required events (messages) will be sent to communicate this change within OpenNMS Horizon.

The IP interface for barbrady.opennms.org is immediately updated

Deleting a Node

Barbrady has not been behaving, as one might expect, so it is time to remove him from the system. Edit the provisioning group, click the delete button next to the node barbrady.opennms.org, click the Done button.

Bronze Provisioning Group definition indicates a node has been removed and requires an import to delete the node entity from the OpenNMS Horizon system

Click the Import button for the Bronze group and the Barbrady node and its interfaces, services, and any other related data will be immediately deleted from the OpenNMS Horizon system. All the required Events (messages) will be sent by Provisiond to provide indication to the OpenNMS Horizon system that the node Barbrady has been deleted.

Barbrady has been deleted

Deleting all the Nodes

There is a convenient way to delete all the nodes that have been provided from a specific foreign source. From the main Admin/Provisioning Groups screen in the Web-UI, click the Delete Nodes button. This button deletes all the nodes defined in the Bronze requisition. It is very important to note that once this is done, it cannot be undone! Well it can’t be undone from the Web-UI and can only be undone if you’ve been good about keeping a backup copy of your `$OPENMS_ETC/` directory
tree. If you've made a mistake, before you re-import the requisition, restore the Bronze.xml requisition from your backup copy to the '$OPENNMS_ETC/imports' directory.

*All node definitions have been removed from the Bronze requisition. The Web-UI indicates an import is now required to remove them from OpenNMS Horizon.*

Clicking the *Import* button will cause the *Audit Phase of Provisiond* to determine that all the nodes from the Bronze group (foreign source) should be deleted from the DB and will create *Delete* operations. At this point, if you are satisfied that the nodes have been deleted and that you will no longer require nodes to be defined in this Group, you will see that the *Delete Nodes* button has now changed to the *Delete Group* button. The *Delete Group* button is displayed when there are no nodes entities from that group (foreign source) in OpenNMS Horizon.

When no node entities from the group exist in OpenNMS Horizon, then the *Delete Group* button is displayed.

11.5.2. Advanced Provisioning Example

In the previous example, we provisioned 3 nodes and let Provisiond complete all of its import phases using a default foreign source definition. Each Provisioning Group can have a separate foreign source definition that controls:

- The rescan interval
- The services to be detected
- The policies to be applied

This example will demonstrate how to create a foreign source definition and how it is used to control the behavior of Provisiond when importing a *Provisioning Group/foreign source requisition*.

First let’s simply provision the node and let the default foreign source definition apply.

*The node definition used for the Advanced Provisioning Example*
Following the import, All the IP and SNMP interfaces, in addition to the interface specified in the requisition, have been discovered and added to the node entity. The default foreign source definition has no policies for controlling which interfaces that are discovered either get persisted or managed by OpenNMS Horizon.

Logical and Physical interface and Service entities directed and discovered by Provisiond.

Service Detection

As IP interfaces are found during the node scan process, service detection tasks are scheduled for each IP interface. The service detections defined in the foreign source determines which services are to be detected and how (i.e. the values of the parameters that parameters control how the service is detected, port, timeout, etc.).

Applying a New Foreign Source Definition

This example node has been provisioned using the Default foreign source definition. By navigating to the Provisioning Groups screen in the OpenNMS Horizon Web-UI and clicking the Edit Foreign Source link of a group, you can create a new foreign source definition that defines service detection and policies. The policies determine entity persistence and/or set attributes on the discovered entities that control OpenNMS Horizon management behaviors.

When creating a new foreign source definition, the default definition is used as a template.
In this UI, new Detectors can be added, changed, and removed. For this example, we will remove detection of all services accept ICMP and DNS, change the timeout of ICMP detection, and a new Service detection for OpenNMS Horizon Web-UI.

Custom foreign source definition created for NMS Provisioning Group (foreign source).

Click the Done button and re-import the NMS Provisioning Group. During this and any subsequent re-imports or re-scans, the OpenNMS Horizon detector will be active, and the detectors that have been removed will no longer test for the related services for the interfaces on nodes managed in the provisioning group (requisition), however, the currently detected services will not be removed. There are 2 ways to delete the previously detected services:

1. Delete the node in the provisioning group, re-import, define it again, and finally re-import again
2. Use the ReST API to delete unwanted services. Use this command to remove each unwanted service from each interface, iteratively:

```
curl -X DELETE -H "Content-Type: application/xml" -u admin:admin
 http://localhost:8980/opennms/rest/nodes/6/ipinterfaces/172.16.1.1/services/DNS
```
There is a sneaky way to do #1. Edit the provisioning group and just change the foreign ID. That will make Provisiond think that a node was deleted and a new node was added in the same requisition! Use this hint with caution and an full understanding of the impact of deleting an existing node.

Provisioning with Policies

The Policy API in Provisiond allow you to control the persistence of discovered IP and SNMP Interface entities and Node Categories during the Scan phase.

Matching IP Interface Policy

The Matching IP Interface policy controls whether discovered interfaces are to be persisted and if they are to be persisted, whether or not they will be forced to be Managed or Unmanaged.

Continuing with this example Provisioning Group, we are going to define a few policies that:

1. Prevent discovered 10 network addresses from being persisted
2. Force 192.168 network addresses to be unmanaged

From the foreign source definition screen, click the Add Policy button and the definition of a new policy will begin with a field for naming the policy and a drop down list of the currently installed policies. Name the policy no10s, make sure that the Match IP Interface policy is specified in the class list and click the Save button. This action will automatically add all the parameters required for the policy.

The two required parameters for this policy are action and matchBehavior.

*The action parameter can be set to DO_NOT_PERSIST, Manage, or UnManage.*

Creating a policy to prevent persistence of 10 network IP interfaces.

The **DO_NOT_PERSIST** action does just what it indicates, it prevents discovered IP interface entities from being added to OpenNMS Horizon when the **matchBehavior** is satisfied. The Manage and UnManage values for this action allow the IP interface entity to be persisted by control whether or not that interface should be managed by OpenNMS Horizon.

The matchBehavior action is a boolean control that determines how the optional parameters will be evaluated. Setting this parameter's value to **ALL_PARAMETERS** causes Provisiond to evaluate each optional parameter with boolean **AND** logic and the value **ANY_PARAMETERS** will cause **OR** logic to be applied.

Now we will add one of the optional parameters to filter the 10 network addresses. The Matching IP Interface policy supports two additional parameters, **hostName** and **ipAddress**. Click the **Add Parameter** link and choose **ipAddress** as the **key**. The value for either of the optional parameters can be an exact or regular expression match. As in most configurations in OpenNMS Horizon where
regular expression matching can be optionally applied, prefix the value with the ~ character.

**Example Matching IP Interface Policy to not Persist 10 Network addresses**

```
Policies (Add Policy)
- name no10s
  - key action value [DO_NOT_PERSIST][Save][Cancel]
  - key matchBehavior value ALL_PARAMETERS
  - key ipAddress value 10.*
```

Any subsequent scan of the node or re-imports of NMS provisioning group will force this policy to be applied. IP Interface entities that already exist that match this policy will not be deleted. Existing interfaces can be deleted by recreating the node in the **Provisioning Groups** screen (simply change the foreign ID and re-import the group) or by using the ReST API:

```
```

The next step in this example is to define a policy that sets discovered 192.168 network addresses to be unmanaged (not managed) in OpenNMS Horizon. Again, click the Add Policy button and let’s call this policy **noMgt192168s**. Again, choose the Mach IP Interface policy and this time set the action to **UNMANAGE**.

**Policy to not manage IP interfaces from 192.168 networks**

```
Policies (Add Policy)
- name noMgt192168s
  - key action value UNMANAGE
  - key matchBehavior value ALL_PARAMETERS
  - key ipAddress value 192.168.*
```

The **UNMANAGE** behavior will be applied to existing interfaces.

**Matching SNMP Interface Policy**

Like the Matching IP Interface Policy, this policy controls the whether discovered SNMP interface entities are to be persisted and whether or not OpenNMS Horizon should collect performance metrics from the SNMP agent for Interface’s index (MIB2 IfIndex).

In this example, we are going to create a policy that doesn’t persist interfaces that are **AAL5** over **ATM** or type **49** (**ifType**). Following the same steps as when creating an IP Management Policy, edit the foreign source definition and create a new policy. Let’s call it: **noAAL5s**. We’ll use Match SNMP Interface class for each policy and add a parameter with **ifType** as the key and 49 as the value.

**Matching SNMP Interface Policy example for Persistence and Data Collection**

```
Policies (Add Policy)
- name noAAL5s
  - key action value UNMANAGE
  - key matchBehavior value ALL_PARAMETERS
  - key ifType value 49
```
At the appropriate time during the scanning phase, Provisiond will evaluate the policies in the foreign source definition and take appropriate action. If during the policy evaluation process any policy matches for a “DO_NOT_PERSIST” action, no further policy evaluations will happen for that particular entity (IP Interface, SNMP Interface).

**Node Categorization Policy**

With this policy, nodes entities will automatically be assigned categories. The policy is defined in the same manner as the IP and SNMP interface polices. Click the Add Policy button and give the policy name, *cisco* and choose the Set Node Category class. Edit the required category key and set the value to *Cisco*. Add a policy parameter and choose the sysObjectId key with a value `~^\1\.3\.6\.1\.4\.1\.*`. 

**Example: Node Category setting policy**

**Script Policy**

This policy allows to use *Groovy* scripts to modify provisioned node data. These scripts have to be placed in the OpenNMS Horizon etc/script-policies directory. An example would be the change of the node’s primary interface or location. The script will be invoked for each matching node. The following example shows the source code for setting the `192.168.100.0/24` interface to PRIMARY while all remaining interfaces are set to SECONDARY. Furthermore the node's location is set to Minneapolis.
import org.opennms.netmgt.model.OnmsIpInterface;
import org.opennms.netmgt.model.monitoringLocations.OnmsMonitoringLocation;
import org.opennms.netmgt.model.PrimaryType;

for (OnmsIpInterface iface : node.getIpInterfaces()) {
    if (iface.getIpAddressAsString().matches("^192\.168\.100\..*$")) {
        LOG.warn(iface.getIpAddressAsString() + " set to PRIMARY")
        iface.setIsSnmpPrimary(PrimaryType.PRIMARY)
    } else {
        LOG.warn(iface.getIpAddressAsString() + " set to SECONDARY")
        iface.setIsSnmpPrimary(PrimaryType.SECONDARY)
    }
}

node.setLocation(new OnmsMonitoringLocation("Minneapolis", ""));

return node;

New Import Capabilities

Several new XML entities have been added to the import requisition since the introduction of the
OpenNMS Importer service in version 1.6. So, in addition to provisioning the basic node, interface,
service, and node categories, you can now also provision asset data.

Provisioning Configuration

The configuration of the Provisioning system has moved from a properties file (model-
importer.properties) to an XML based configuration container. The configuration is now extensible
to allow the definition of 0 or more import requisitions each with their own Cron based schedule
for automatic importing from various sources (intended for integration with external URL such as
HTTP and this new DNS protocol handler.

A default configuration is provided in the OpenNMS Horizon etc/ directory and is called:
provisiond-configuration.xml. This default configuration has an example for scheduling an import
from a DNS server running on the localhost requesting nodes from the zone, localhost and will be
imported once per day at the stroke of midnight. Not very practical but is a good example.
Configuration Reload

Like many of the daemon configurations in the 1.7 branch, Provisiond's configuration is re-loadable without having to restart OpenNMS. Use the reloadDaemonConfig uei:

```
/opt/opennms/bin/send-event.pl uei.opennms.org/internal/reloadDaemonConfig --parm
'daemonName Provisiond'
```

This means that you don't have to restart OpenNMS Horizon every time you update the configuration!

Provisioning Asset Data

The Provisioning Groups Web-UI had been updated to expose the ability to add Node Asset data in an import requisition. Click the Add Node Asset link and you can select from a drop down list all the possible node asset attributes that can be defined.
After an import, you can navigate to the Node Page and click the Asset Info link and see the asset data that was just provided in the requisition.

**External Requisition Sources**

Because Provisiond takes a *URL* as the location service for import requisitions, OpenNMS Horizon can be easily extended to support sources in addition to the native URL handling provided by Java: *file://*, *http://*, and *https://*. When you configure Provisiond to import requisitions on a schedule you specify using a *URL* Resource. For requisitions created by the Provisioning Groups WebUI, you can specify a file based URL.

> <need further documentation>

**Provisioning Nodes from DNS**

The new Provisioning service in OpenNMS Horizon is continuously improving and adapting to the needs of the community. One of the most recent enhancements to the system is built upon the very flexible and extensible API of referencing an import requisition's location via a URL. Most commonly, these URLs are files on the file system (i.e. *file://opt/opennms/etc/imports/<my-provisioning-group.xml>*)) as requisitions created by the Provisioning Groups UI. However, these same requisitions for adding, updating, and deleting nodes (based on the original model importer) can also come from URLs specifying the HTTP protocol: *http://myinventory.server.org/nodes.cgi*

Now, using Java’s extensible protocol handling specification, a new protocol handler was created so that a URL can be specified for requesting a Zone Transfer (AXFR) request from a DNS server. The A
records are recorded and used to build an import requisition. This is handy for organizations that use DNS (possibly coupled with an IP management tool) as the data base of record for nodes in the network. So, rather than ping sweeping the network or entering the nodes manually into OpenNMS Horizon Provisioning UI, nodes can be managed via 1 or more DNS servers. The format of the URL for this new protocol handler is:

\[
\text{dns://}<\text{host}>[::<\text{port}>]/<\text{zone}>[::<\text{foreign-source}>]/[?\text{expression}=<\text{regex}>]
\]

**Simple Example**

\[
\text{dns://my-dns-server/myzone.com}
\]

This will import all A records from the host my-dns-server on port 53 (default port) from zone myzone.com and since the foreign source (a.k.a. the provisioning group) is not specified it will default to the specified zone.

**Using a Regular Expression Filter**

You can also specify a subset of the A records from the zone transfer using a regular expression:

\[
\text{dns://my-dns-server/myzone.com/ myriad/} <\text{expression}=^\text{por-}.*
\]

This will import all nodes from the same server and zone but will only manage the nodes in the zone matching the regular expression ^por-..* and will and they will be assigned a unique foreign source (provisioning group) for managing these nodes as a subset of nodes from within the specified zone.

**URL Encoding**

If your expression requires URL encoding (for example you need to use a ? in the expression) it must be properly encoded.

\[
\text{dns://my-dns-server/myzone.com/ myriad/} <\text{expression}=^\text{por}[0-9]%3F
\]

**DNS Setup**

Currently, the DNS server requires to be setup to allow a zone transfer from the OpenNMS Horizon server. It is recommended that a secondary DNS server is running on OpenNMS Horizon and that the OpenNMS Horizon server be allowed to request a zone transfer. A quick way to test if zone transfers are working is:

\[
\text{dig -t AXFR @<dn5Server> <zone>}
\]

### 11.6. Adapters

The OpenNMS Horizon Provisiond API also supports Provisioning Adapters (plugins) for integration
with external systems during the provisioning Import phase. When node entities are added, updated, deleted, or receive a configuration management change event, OpenNMS Horizon will call the adapter for the provisioning activities with integrated systems.

Currently, OpenNMS Horizon supports the following adapters:

**11.6.1. DDNS Adapter**

The Opposite end of Provisiond integration from the DNS Requisition Import, is the DDNS adapter. This adapter uses the dynamic DNS protocol to update a DNS system as nodes are provisioned into OpenNMS Horizon. To configure this adapter, edit the `opennms.properties` file and set the `importer.adapter.dns.server` property:

```
importer.adapter.dns.server=192.168.1.1
```

**11.6.2. RANCID Adapter**

Integration has been integrated with RANCID though this new API.

- <More documentation needed>
- Maps (soon to be moved to Mapd) <documentation required>
- WiMax-Link (soon to be moved to Linkd) <documentation required>

**11.7. Meta-Data assigned to Nodes**

A requisition can contain arbitrary meta-data for each node, interface and service it contains. During provisioning, the meta-data is copied to the model and persisted in the database.

The Requisition UI allows to edit the meta-data defined in a requisition. The edit function in the Requisition UI is limited to only edit the context called `requisition` by intention. All other contexts are reserved for future use by other provisioning-adapters and similar applications like asset-data.

While provisioning a requisition, the meta-data from the requisition is transferred to the database and assigned to the nodes, interfaces and services accordingly.

**11.7.1. User defined contexts**

If there is a requirement to add more contexts not managed by OpenNMS Horizon, the context name must be prefixed by `X-`. Any third-party software must take care to choose a context name which is unique enough to not conflict with other software.

**11.8. Integrating with Provisiond**

The ReST API should be used for integration from other provisioning systems with OpenNMS
11.8.1. Provisioning Groups of Nodes

Just as with the WebUI, groups of nodes can be managed via the ReST API from an external system. The steps are:

1. Create a Foreign Source (if not using the default) for the group
2. Update the SNMP configuration for each node in the group
3. Create/Update the group of nodes

11.8.2. Example

Step 1 - Create a Foreign Source

If policies for this group of nodes are going to be specified differently than the default policy, then a foreign source should be created for the group. Using the ReST API, a foreign source can be provided. Here is an example:

The XML file: `customer-a.foreign-source.xml`:

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<foreign-source
    date-stamp="2009-10-12T17:26:11.616-04:00"
    name="customer-a"
    xmlns="http://xmlns.opennms.org/xsd/config/foreign-source"
>
    <scan-interval>1d</scan-interval>
    <detectors>
        <detector
            class="org.opennms.netmgt.provision.detector.icmp.IcmpDetector"
            name="ICMP"/>
        <detector
            class="org.opennms.netmgt.provision.detector.snmp.SnmpDetector"
            name="SNMP"/>
    </detectors>
    <policies>
        <policy
            class="org.opennms.netmgt.provision.persist.policies.MatchingIpInterfacePolicy"
            name="no-192-168">
            <parameter value="UNMANAGE" key="action"/>
            <parameter value="ALL_PARAMETERS" key="matchBehavior"/>
            <parameter value="~^192\.[0-9].*" key="ipAddress"/>
        </policy>
    </policies>
</foreign-source>
```

Here is an example curl command used to create the foreign source with the above foreign source specification above:

Now that you've created the foreign source, it needs to be deployed by Provisiond. Here an the example using the curl command to deploy the foreign source:

curl -v -u admin:admin
http://localhost:8980/opennms/rest/foreignSources/pending/customer-a/deploy -X PUT

The current API doesn’t strictly follow the ReST design guidelines and will be updated in a later release.

**Step 2 - Update the SNMP configuration**

The implementation only supports a PUT request because it is an implied "Update" of the configuration since it requires an IP address and all IPs have a default configuration. This request is passed to the SNMP configuration factory in OpenNMS Horizon for optimization of the configuration store snmp-config.xml. This example changes the community string for the IP address 10.1.1.1 to yRuSonoZ.

Community string is the only required element

curl -v -X PUT -H "Content-Type: application/xml" -H "Accept: application/xml" -d <snmp-info><community>yRuSonoZ</community><port>161</port><retries>1</retries><timeout>2000</timeout><version>v2c</version></snmp-info> -u admin:admin
http://localhost:8980/opennms/rest/snmpConfig/10.1.1.1

**Step 3 - Create/Update the Requisition**

This example adds 2 nodes to the Provisioning Group, customer-a. Note that the foreign-source attribute typically has a 1 to 1 relationship to the name of the Provisioning Group requisition. There is a direct relationship between the foreign-source attribute in the requisition and the foreign source policy specification. Also, typically, the name of the provisioning group will also be the same. In the following example, the ReST API will automatically create a provisioning group based on the value foreign-source attribute specified in the XML requisition.
curl -X POST -H "Content-Type: application/xml" -d "<?xml version="1.0" encoding="UTF-8"?>
<model-import xmlns="http://xmlns.opennms.org/xsd/config/model-import" date-stamp="2009-03-07T17:56:53.123-05:00" last-import="2009-03-07T17:56:53.117-05:00" foreign-source="customer-a">
  <node node-label="p-brane" foreign-id="1">
    <interface ip-addr="10.0.1.3" descr="en1" status="1" snmp-primary="P">
      <monitored-service service-name="ICMP"/>
      <monitored-service service-name="SNMP"/>
    </interface>
    <category name="Production"/>
    <category name="Routers"/>
  </node>
  <node node-label="m-brane" foreign-id="1">
    <interface ip-addr="10.0.1.4" descr="en1" status="1" snmp-primary="P">
      <monitored-service service-name="ICMP"/>
      <monitored-service service-name="SNMP"/>
    </interface>
    <category name="Production"/>
    <category name="Routers"/>
  </node>
</model-import>" -u admin:admin
http://localhost:8980/opennms/rest/requisitions

A provisioning group file called etc/imports/customer-a.xml will be found on the OpenNMS Horizon system following the successful completion of this curl command and will also be visible via the WebUI.

Add, Update, Delete operations are handled via the ReST API in the same manner as described in detailed specification.

11.9. Provisioning Single Nodes (Quick Add Node)

Adding a Node to a Current Requisition

Often, it is requested that a single node add/update be completed for an already defined provisioning group. There is a ReST API for the Add Node implementation found in the OpenNMS Horizon Web-UI. For this to work, the provisioning group must already exist in the system even if there are no nodes defined in the group.

1. Create a foreign source (if required)
2. Specify SNMP configuration
3. Provide a single node with the following specification

11.10. Fine Grained Provisioning Using provision.pl

provision.pl provides an example command-line interface to the provisioning-related OpenNMS Horizon REST API endpoints.

The script has many options but the first 3 optional parameters are described here:

You can use --help to the script to see all the available options.

--username (default: admin)  
--password (default: admin)  
--url (default: http://localhost:8980/opennms/rest)
11.10.1. Create a new requisition

provision.pl provides easy access to the requisition REST service using the requisition option:

```
${OPENNMS_HOME}/bin/provision.pl requisition customer1
```

This command will create a new, empty (containing no nodes) requisition in OpenNMS Horizon. The new requisition starts life in the pending state. This allows you to iteratively build the requisition and then later actually import the nodes in the requisition into OpenNMS Horizon. This handles all adds/changes/deletes at once. So, you could be making changes all day and then at night either have a schedule in OpenNMS Horizon that imports the group automatically or you can send a command through the REST service from an outside system to have the pending requisition imported/reimported.

You can get a list of all existing requisitions with the list option of the provision.pl script:

```
${OPENNMS_HOME}/bin/provision.pl list
```

Create a new Node

```
${OPENNMS_HOME}/bin/provision.pl node add customer1 1 node-a
```

This command creates a node element in the requisition customer1 called node-a using the script's node option. The node's foreign-ID is 1 but it can be any alphanumeric value as long as it is unique within the requisition. Note the node has no interfaces or services yet.

Add an Interface Element to that Node

```
${OPENNMS_HOME}/bin/provision.pl interface add customer1 1 127.0.0.1
```

This command adds an interface element to the node element using the interface option to the provision.pl command and it can now be seen in the pending requisition by running provision.pl requisition list customer1.

Add a Couple of Services to that Interface

```
${OPENNMS_HOME}/bin/provision.pl service add customer1 1 127.0.0.1 ICMP
${OPENNMS_HOME}/bin/provision.pl service add customer1 1 127.0.0.1 SNMP
```

This adds the 2 services to the specified 127.0.0.1 interface and is now in the pending requisition.
Set the Primary SNMP Interface

```
${OPENNMS_HOME}/bin/provision.pl interface set customer1 1 127.0.0.1 snmp-primary P
```

This sets the 127.0.0.1 interface to be the node’s Primary SNMP interface.

Add a couple of Node Categories

```
${OPENNMS_HOME}/bin/provision.pl category add customer1 1 Routers
${OPENNMS_HOME}/bin/provision.pl category add customer1 1 Production
```

This adds the two categories to the node and is now in the pending requisition.

These categories are case-sensitive but do not have to be already defined in OpenNMS Horizon. They will be created on the fly during the import if they do not already exist.

Setting Asset Fields on a Node

```
${OPENNMS_HOME}/bin/provision.pl asset add customer1 1 serialnumber 9999
```

This will add value of 9999 to the asset field: serialnumber.

Deploy the Import Requisition (Creating the Group)

```
${OPENNMS_HOME}/bin/provision.pl requisition import customer1
```

This will cause OpenNMS Horizon Provisiond to import the pending customer1 requisition. The formerly pending requisition will move into the deployed state inside OpenNMS Horizon.

Deleting a Node from a Requisition

Very much the same as the add, except that a single delete command and a re-import is required. What happens is that the audit phase is run by Provisiond and it will be determined that a node has been removed from the requisition and the node will be deleted from the DB and all services will stop activities related to it.

```
${OPENNMS_HOME}/bin/provision.pl node delete customer1 1 node-a
${OPENNMS_HOME}/bin/provision.pl requisition import customer1
```

This completes the life cycle of managing a node element, iteratively, in a import requisition.

11.11. Yet Other API Examples

List the Nodes in a Provisioning Group

The provision.pl script doesn’t supply this feature but you can get it via the REST API. Here is an
example using **curl**:

```
#!/bin/bash
REQ=$1
curl -X GET -H "Content-Type: application/xml" -u admin:admin
http://localhost:8980/opennms/rest/requisitions/$REQ 2>/dev/null | xmllint --format -
```

### 11.12. SNMP Profiles

SNMP Profiles are prefabricated sets of SNMP configuration which are automatically "fitted" against eligible IP addresses at provisioning time. Each profile may have a unique label and an optional filter expression. If the filter expression is present, it will be evaluated to check whether a given IP address or reverse-lookup hostname passes the filter. A profile with a filter expression will be fitted to a given IP address only if the filter expression evaluates true against that IP address.

SNMP profiles can be added to snmp-config.xml to enable automatic fitting of SNMP interfaces.

**Sample snmp-config.xml with profiles**

```xml
<snmp-config xmlns="http://xmlns.opennms.org/xsd/config/snmp" write-community="private" read-community="public" timeout="800" retry="3">
  <definition version="v1" ttl="6000">
    <specific>127.0.0.1</specific>
  </definition>
  <profiles>
    <profile version="v1" read-community="horizon" timeout="10000">
      <label>profile1</label>
    </profile>
    <profile version="v1" ttl="6000">
      <label>profile2</label>
      <filter>hostname LIKE '%opennms%'</filter>
    </profile>
    <profile version="v1" read-community="meridian">
      <label>profile3</label>
      <filter>IPADDR IPLIKE 172.1.*.*</filter>
    </profile>
  </profiles>
</snmp-config>
```

In the above config,

1. **profile1** doesn’t have a filter expression. This profile will be tried for every interface.
2. **profile2** has a filter expression that compares `hostname` (the hostname resulting from a reverse DNS lookup of the IP address being fitted) against a preconfigured value. This profile’s SNMP parameters will be fitted only against IP addresses whose hostname contains the string `opennms`.
3. **profile3** has an IPLIKE expression that matches all interfaces in the range specified in the filter.
This profile's SNMP parameters will be fitted only against IP addresses in the range specified by the IPLIKE expression.

Profiles will be tried in the order they are configured. The first match that produces a successful SNMP GET-REQUEST on the scalar instance of sysObjectID will be saved by Provisiond as the SNMP configuratoin definition to use for all future SNMP operations against the fitted IP address.

**default** as profile label is reserved for default SNMP config.

### Fit a SNMP profile

The opennms:snmp-fit Karaf shell command finds a matching profile for a given IP address and prints out the resulting config.

Matching or "fitting" an SNMP profile should be understood as passing the profile's filter expression and success in getting the scalar sysObjectID instance.

```
$ ssh -p 8101 admin@localhost
...
admin@opennms() > opennms:snmp-fit -l MINION -s 172.1.1.105 ①
admin@opennms() > opennms:snmp-fit 172.1.1.106 profile1 ②
```

① searches the profiles that fit the IP address 172.1.1.105 at location Minion and saves the resulting configuration as a definition for future use.

② checks whether the profile with label profile1 is a fit for IP address 172.1.1.106. If it succeeds, it prints out the resulting agent config, but does not save any definition.

### Remove an IP address from definition.

The opennms:snmp-remove-from-definition Karaf shell command removes an IP address from the system-wide SNMP configuration definitions.

```
$ ssh -p 8101 admin@localhost
...
admin@opennms() > opennms:snmp-remove-from-definition -l MINION 172.1.0.255
```

This removes IP address 172.1.0.255 at location MINION from the system-wide SNMP configuration so that this IP address can be fitted to a new profile. This command might be useful when an IP address formerly assigned to an SNMPv2c-capable switch is reassigned to an SNMPv3-capable load balancer.

### Using SNMP profiles in Snmp Detector

By default SnmpDetector doesn’t use SNMP profiles. Add property useSnmpProfiles and set it to true in order to use SNMP Profiles.
11.13. Auto Discovery with Detectors

Currently OpenNMS Horizon uses ICMP ping sweep to find IP address on the network. The IP Ranges and specifics can be defined in discovery-configuration.xml as shown below.

Sample discovery configuration

```xml
<discovery-configuration xmlns="http://xmlns.opennms.org/xsd/config/discovery"
packets-per-second="1"
    initial-sleep-time="30000" restart-sleep-time="86400000" retries="1"
timeout="2000">
    <!-- see examples/discovery-configuration.xml for options -->
    <specific>10.0.0.5</specific>
    <include-range>
        <begin>192.168.0.1</begin>
        <end>192.168.0.254</end>
    </include-range>
    <include-url>file:/opt/opennms/etc/include.txt</include-url>
</discovery-configuration>
```

Auto Discovery with Detectors allows users to specify the services that needs to be detected apart from ICMP ping for the IP Addresses to be discovered. Only when specified detectors succeeds, auto discovery will send new suspect event.

Sample Configuration with detectors is shown below.
In above configuration, specifics and ranges are moved into definition with SNMP and reverse-dns-lookup detectors. When all of the detectors succeeds at a given location, then only the specific IP Address considered to be discovered.

A definition without any detectors will fall back to ICMP ping for discovery.

**11.14. Service Detectors**

Service detectors allow to bind a service to an interface automatically if it is detected during provisioning of a requisition.
11.14.1. Meta-Data-DSL

Service detectors can leverage dynamic configuration by using the Meta-Data-DSL in each possible parameter.

During evaluation of an expression the following scopes are available:

- Node meta-data
- Interface meta-data

11.14.2. HTTP Detector

This detector is used to find and assigns services based on HTTP.

Detector facts

| Implementation | org.opennms.netmgt.provision.detector.simple.HttpDetector |

Configuration and Usage

Table 100. Parameters for the HTTP detector

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>checkRetCode</td>
<td>If set to true only HTTP status codes that are the same or lower than the value of maxRetCode pass.</td>
<td>optional</td>
<td>false</td>
</tr>
<tr>
<td>maxRetCode</td>
<td>Highest HTTP response code that passes. maxRetCode is only evaluated if checkRetCode is set to true.</td>
<td>optional</td>
<td>399</td>
</tr>
<tr>
<td>port</td>
<td>Port to query</td>
<td>optional</td>
<td>80</td>
</tr>
<tr>
<td>url</td>
<td>Url to query</td>
<td>optional</td>
<td>/</td>
</tr>
<tr>
<td>timeout</td>
<td>Timeout in milliseconds to wait for a response.</td>
<td>optional</td>
<td>2000</td>
</tr>
</tbody>
</table>

Please note: The Http Detector makes only one http request and doesn’t follow redirects.

Example Configuration
11.14.3. HTTPS Detector

This detector is used to find and assigns services based on HTTPS.

Detector facts

| Implementation | org.opennms.netmgt.provision.detector.simple.HttpsDetector |

Configuration and Usage

Parameters for the HTTPS detector

The parameters are the same as for the HTTP detector

11.14.4. SNMP Detector

This detector is used to find and assigns services based on SNMP. The detector binds a service with a given Service Name when a particular SNMP OID as scalar or table matches a given criteria.

Detector facts

| Implementation | org.opennms.netmgt.provision.detector.snmp.SnmpDetector |

Configuration and Usage

Table 101. Parameters for the SNMP detector

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>oid</td>
<td>SNMP OID for scalar or table to detect the service.</td>
<td>required</td>
<td>.1.3.6.1.2.1</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>.1.2.0</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Required</td>
<td>Default Value</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>----------</td>
<td>---------------</td>
</tr>
<tr>
<td>retry</td>
<td>Number of retries to detect the service.</td>
<td>optional</td>
<td>agent config</td>
</tr>
<tr>
<td>timeout</td>
<td>Timeout in milliseconds to wait for a response from the SNMP agent.</td>
<td>optional</td>
<td>agent config</td>
</tr>
<tr>
<td>vbvalue</td>
<td>expected return value to detect the service; if not specified the service is detected if the SNMP OID returned any kind of valid value. The vbvalue is evaluated as Java Regular Expression.</td>
<td>optional</td>
<td>-</td>
</tr>
<tr>
<td>hex</td>
<td>Set true if the data is from type HEX-String.</td>
<td>optional</td>
<td>false</td>
</tr>
<tr>
<td>isTable</td>
<td>Set true if detector should evaluate SNMP tables.</td>
<td>optional</td>
<td>false</td>
</tr>
<tr>
<td>matchType</td>
<td>Set match type to evaluate the expected value in the SNMP table. EXIST: the expected vbvalue is ignored, service detected if the given table under OID exist. ALL: all values in the table must match against expected vbvalue to detect service. ANY: at least one value in the table must match against expected vbvalue to detect service. NONE: None of the values should match against expected value to detect service.</td>
<td>optional</td>
<td>EXIST</td>
</tr>
<tr>
<td>useSnmpProfiles</td>
<td>Set true if detector should use SNMP profiles to detect SNMP service.</td>
<td>optional</td>
<td>false</td>
</tr>
<tr>
<td>ttl</td>
<td>Time to live in milliseconds to wait for a response from the Minion.</td>
<td>optional</td>
<td>20000</td>
</tr>
</tbody>
</table>

**Example for SNMP scalar value**

We have Dell server farm and want to monitor the global server status provided by the OpenManage Server Administrator. Global status is provided by a scalar OID 1.3.6.1.4.1.674.10892.1.200.1.2.1. The service should be automatically detected if the server supports this OID.

For provisioning we have a requisition named Server which contains all server of our data center. A Detector with the name Dell-OMSA-Global-State for this requisition is created with the following parameter:

**Table 102. Parameters for the SNMP detector**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Dell-OMSA-Global-State</td>
</tr>
</tbody>
</table>
When the requisition Server is synchronized the service Dell-OMSA-Global-State will be detected in case they support the given SNMP OID.

Example using SNMP tables

We have a HP server farm and want to monitor the status of logical drives over SNMP provided from HP Insight Manager. The status for logical drives is provided in a SNMP Table under .1.3.6.1.4.1.232.3.2.3.1.1.4. The service should be automatically assigned to all servers exposing the given SNMP OID.

For provisioning we have a requisition named Server which contains all server of our data center. A Detector with the name HP-Insight-Drive-Logical for this requisition is created with the following parameter:

**Table 103. Parameters for the SNMP detector**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>oid</td>
<td>.1.3.6.1.4.1.674.10892.1.200.10.1.2.1</td>
</tr>
<tr>
<td>isTable</td>
<td>true</td>
</tr>
</tbody>
</table>

When the requisition Server is synchronized the service HP-Insight-Drive-Logical will be detected in case they support the given SNMP OID table.

11.14.5. WS-Man Detector

The WS-Management detector attempts to connect to the agent defined in wsman-config.xml and issues an Identify command. If the Identify command is successful, the service is marked as detected and the product details returned by the command are optionally stored in the asset fields (see details below.)

**Detector facts**

| Implementation | org.opennms.netmgt.provision.detector.wsman.WsManDetector |

**Configuration and Usage**

*Table 104. Parameters for the <DETECTOR-NAME-HERE>*
### Examples

If a valid response to the Identify command is received, the product vendor and product version are stored in the `vendor` and `modelNumber` fields of the associated node's assets table.

For example, a Windows Server 2008 machine returns:

<table>
<thead>
<tr>
<th>Product Vendor</th>
<th>Microsoft Corporation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Product Version</td>
<td>OS: 6.1.7601 SP: 1.0 Stack: 2.0</td>
</tr>
</tbody>
</table>

If these assets field are being used for another purpose, this behavior can be disabled by setting the `updateAssets` parameters to `false` in the detector configuration of the appropriate foreign source.

Some agents may respond to the Identify command with generic identities such as Openwsman 2.0.0. These values can be overridden by specifying the `product-vendor` and `product-version` attributes in `wsman-config.xml`.

Example detector configuration:

```xml
<detector name="WS-Man" class="org.opennms.netmgt.provision.detector.wsman.WsManDetector">
  <parameter key="updateAssets" value="true"/>
</detector>
```

The response is logged as `DEBUG` information in `provisiond.log` and looks like the following:
The information of the asset fields are used in the System Definition Rule to decide which performance metrics will be gathered from Collectd.

11.14.6. WS-Man WQL Detector

The WS-Management WQL detector attempts to connect to the agent defined in wsman-config.xml and issues a WQL query. If the query successfully returns one or more items, the service is marked as detected. The WS-Man WQL detector can be used to define arbitrary services based on WQL filter results.

Detector facts

| Implementation | org.opennms.netmgt.provision.detector.wsman.WsManWQLDetector |

Configuration and Usage

Table 105. Parameters for the <DETECTOR-NAME-HERE>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>resourceUri</td>
<td>A resourceUri consists of a prefix and a path to a resource.</td>
<td>yes</td>
<td><a href="http://schemas.microsoft.com/wbem/wsman/1/wmi/root/cimv2/">http://schemas.microsoft.com/wbem/wsman/1/wmi/root/cimv2/</a>*</td>
</tr>
<tr>
<td>wql</td>
<td>A query using the WQL filter dialect</td>
<td>yes</td>
<td>none</td>
</tr>
<tr>
<td>serviceName</td>
<td>A custom service name to identify this service</td>
<td>no</td>
<td>WsManWQLService</td>
</tr>
</tbody>
</table>

Examples

Example detector configuration:

```xml
<detector name="WinRM" class="org.opennms.netmgt.provision.detector.wsman.WsManWQLDetector">
  <parameter key="resourceUri" value="http://schemas.microsoft.com/wbem/wsman/1/wmi/root/cimv2/*"/>
  <parameter key="serviceName" value="WinRM"/>
  <parameter key="wql" value="select Name,Status from Win32_Service where Name = 'WinRM' and StartMode='Auto' and Status = 'OK'"/>
</detector>
```

The response is logged as `DEBUG` information in `provisiond.log` and looks like the following:
11.14.7. Reverse-DNS-Lookup Detector

This detector tries to detect if a given IP Address can be found in PTR records.

Detector facts

```
| Implementation | org.opennms.netmgt.provision.detector.rdns.ReverseDNSLookupDetector |
```

Configuration and Usage

**Parameters for the Reverse-DNS-Lookup Detector**

Reverse DNS Lookup Detector doesn't take any parameters.
Examples

Reverse-DNS-Lookup Detector can be used in auto discovery with detectors to discover IP Addresses that only resolve FQDN.
Chapter 12. Business Service Monitoring

While *OpenNMS Horizon* detects issues in your network by device, interface or service, the *Business Service Monitoring (BSM)* takes it one step further. The *BSM* components allow you to monitor and model high level *Business Services (BS)* and helps quickly identify the most critical problems affecting these. With the *BSM* feature it is possible to model a high level *BS* context around the technical *Service Monitors* provided in *OpenNMS Horizon*. To indicate which *BS* is affected by events at the technical *Service Monitors* level, a *BS Operational Status* is calculated.

As an example, let’s assume a company runs an online store. Customers enter through a login system, select items, place them in the shopping cart and checkout using a payment system. The whole service is provided by a few web servers and access data from databases. To monitor the status of the databases, a *SQL* service monitor on each database server is configured. For testing the web servers a *HTTP* service monitor is used for each of them. Covering the overall functionality a *Page Sequence Monitor (PSM)* is used to test the login, shop and payment workflow through the provided web portal. A possible representation of the whole system hierarchy is shown in figure Example scenario for a web shop.

*Example scenario for a web shop*

To be able to model this scenarios the *BSM* functions can be used. The *Business Service Monitoring (BSM)* feature includes the following components:

- *Business Service Monitoring Daemon (BSMD)*: Maintains and drives the state of all *BS*
- *Business Service Editor*: Web application which allows you to create, update or delete *BS*
- *Topology View for Business Services*: Visual representation of the *Business Service Hierarchy* as a component of the *Topology User Interface*.
- *BSM ReST API*: ReST based API to create, read, update or delete *BS*
12.1. Business Service Hierarchy

BS can depend on each other and build together a Business Service Hierarchy. It can be visualized using the Topology User Interface with the Business Services View. The Operational Status of a BS is ultimately calculated from Alarms and their Severity. To define the class of Alarms a Reduction Key is used and is represented as an Edge of a BS. Giving more granularity than just Up or Down, the Operational Status uses the Severities, i.e. Normal, Warning, Minor, Major, Critical.

Based on the hierarchy, the Operational Status is calculated with Map and Reduce Functions. A Map Function influences which Severity from the Edge is used as an input to the BS. A Reduce Function is used to consolidate the Severities from all Edges of a BS and uses them as inputs and reduces them into a single Severity, which is the Operational Status.

The Topology User Interface allows users to traverse Business Service Hierarchies using the Semantic Zoom Level (SZL). The Semantic Zoom Level (SZL, pronounced as ‘sizzle’) defines how many Neighbors are shown related to the elements which are in Focus. The number can be interpreted as how many Hops from the Focus should be shown on the Topology User Interface.

Figure 35. Business Service Hierarchy components

① A top-level Business Service which depends on other Business Services, Monitored Services and Alarms (referenced by Reduction Key)
② Business Service as child an the Operational Status is used as input for the top-level Business Service
③ IP Service Edge used as an input with auto generated Reduction Keys for node down, interface down and node lost service
④ Reduction Key Edge used as an input to the top-level BS, which references just a node lost service of a Page Sequence Monitor for the user login

To add or remove an additional selected BS or Edge to Focus use in the context menu Add To Focus or Remove From Focus. If you want to have a specific _BS or Edge as a single focus use Set as Focal
Point. The Eye icon highlights all elements in the Topology UI which are set to Focus.

12.2. Operational status

Every Business Service maintains an Operational Status that represents the overall status calculated by the Map and Reduce Functions from the Edges. The Operational Status uses the Severities known from Events and Alarms.

Table 106. Operational Status representation

<table>
<thead>
<tr>
<th>Name</th>
<th>Numerical code</th>
<th>Color / Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Critical</td>
<td>7</td>
<td>Purple / #c00</td>
<td>This event means that a severe service affecting event has occurred.</td>
</tr>
<tr>
<td>Major</td>
<td>6</td>
<td>Red / #f30</td>
<td>Indicates serious disruption or malfunction of a service or system.</td>
</tr>
<tr>
<td>Minor</td>
<td>5</td>
<td>Orange / #f90</td>
<td>Used for troubles that have not immediate effect on service or system performance.</td>
</tr>
<tr>
<td>Warning</td>
<td>4</td>
<td>Yellow / #fc0</td>
<td>An event has occurred that may require action. This severity can also be used to indicate a condition that should be noted (logged) but does not require immediate action.</td>
</tr>
<tr>
<td>Normal</td>
<td>3</td>
<td>Dark green / #360</td>
<td>Informational message. No action required.</td>
</tr>
<tr>
<td>Cleared</td>
<td>2</td>
<td>Grey / #eee</td>
<td>This severity is reserved for use in alarms to indicate that an alarm describes a self-clearing error condition has been corrected and service is restored. This severity should never be used in event definitions. Please use &quot;Normal&quot; severity for events that clear an alarm.</td>
</tr>
<tr>
<td>Indeterminate</td>
<td>1</td>
<td>Light green / #990</td>
<td>No Severity could be associated with this event.</td>
</tr>
</tbody>
</table>

If a Business Service changes its Operational Status an OpenNMS event of the type uei.opennms.org/bsm/serviceOperationalStatusChanged is generated and sent to the OpenNMS Event Bus. In case the Operational Status changed from Normal to a higher Severity an Event of the type uei.opennms.org/bsm/serviceProblem is generated and has the Severity of the BS. When the BS goes back to normal a Event of the type uei.opennms.org/bsm/serviceProblemResolved is generated.

The Service Problem and Service Problem Resolved events can be used for notifications or ticketing integration.

The log message of the events have the following information:

- **Business Service Name:** businessServiceName
- **Business Service Identifier:** id
The BSM events are not associated to a Node, Interface or Service.

### 12.3. Root Cause and Impact Analysis

The **Root Cause** operation can be used to quickly identify the underlying **Reduction Keys** as **Edges** that contribute to the current **Operational Status** of an element. The **Impact Analysis** operation, converse to the **Root Cause** operation, can be used to identify all of the **BS** affected by a given element. Both of these options are available in the context menu of the **Topology User Interface** when visualizing **BS**.

The following example shows how to identify the **Root Cause** of the critical status of the **Shop** service. Use the **Context Menu** on the **BS** to investigate the **Root Cause** shown in figure **View before performing Root Cause Analysis**.

#### View before performing Root Cause Analysis

![Diagram showing the root cause analysis process](image)

The **Topology UI** sets only elements to **Focus** which are the reason for the **Operational Status** of the selected **BS**. In figure **View after performing Root Cause Analysis** the **Page Sequence Monitor** which tests the user login is down and has set the **BS** to a critical status.

#### View after performing Root Cause Analysis
Similar to identifying a root cause for a BS it is also possible to identify which Business Services from a specific Edge are affected. Use the Context Menu on a specific Edge element and select Impact Analysis shown in figure View before performing Impact Analysis.

In figure View after performing Impact Analysis the Business Services for Login, Shop and Payment are affected if this HTTP service is unavailable.

View after performing Impact Analysis
For the reason the service *PSM Shop* is introducing the critical status for the *Business Service Shop*, the *HTTP* service has no impact on the *Operational Status* of the *PSM Shop* and is not shown.

### 12.4. Simulation Mode

To visualize if the configured behavior works as expected, the *Simulation Mode* can be used to manually set an *Alarm* status of an *Edge* element. The *Operational Status* is calculated with the given *Map and Reduce Functions*. This allows users to validate and tune their *Business Service Hierarchies* until the desired status propagation is achieved.

In order to enter *Simulation Mode*, open the *Business Service View* in the *Topology User Interface* and toggle the *Simulation Mode* option in the *Simulate* menu at the top of the screen. The *Info Panel* on the left hand side allows to set the *Severity* of the selected *Edge* element. In figure *BSM Simulation Mode* the *Menu* and *Severity* setting is shown.

*BSM Simulation Mode*
The **Info Panel** can be hidden with the **Arrow** button in the top left corner.

In the **Simulate** menu there are **Inherit State** and **Reset State** as options available. With **Inherit State** the current **Severities** and **Operational Status** from monitoring is used for the **Simulation Mode**. By selecting **Reset State** all states will be set to **Normal** for simulation.

### 12.5. Share View

In some cases it is useful to share a specific view on a **Business Service Hierarchy**. For this reason the menu function **Share** can be used and generates a link for the current view and can be copied and sent to another user. In figure **Share Business Service View** the **Share** menu item was used and a link is generated. The link can be used with **Copy & Paste** and sent to another user to have access to exactly the same configured **Business Service View**.

**Share Business Service View**
The user receiving the link needs an account in OpenNMS to be able to see the Business Service View.

12.6. Change Icons

Each element in the Business Service View has an icon which is assigned to a BS or an Edge. To be able to customize the Business Service View the icons for each element can be changed. Select the element in the Business Service View and choose Change Icon from the Context Menu. As shown in figure Change Icon for Business Service or Edges select the the new icon for the selected element and click Ok to permanently assign the new icon to the element.

It is also possible create custom Icon Sets which is described in the Business Service Monitoring section of the Developer Guide.

12.7. Business Service Definition

The status of Service Monitors and any kind of Alarm can be used to drive the Operational Status of a BS. A BS is defined with the following components:

- **Business Service Name**: A unique name used to identify the BS
- **Edges**: A set of elements on which this BS relies which can include other BS, or Reduction Keys.
- **Reduce Function**: Function used to aggregate the Operational Status from all the Edges. Specific functions may take additional parameters.
- **Attributes**: Optional key/value pairs that can be used to tag or enrich the Business Service with additional information.

Each Business Service can contain a list of optional key/value attributes. These can be used to identify or tag the BS, and may be reference in other workflows. These attributes do not affect the
dependencies or the status calculation of the BS.

Attributes can be used to filter BS in Ops Board dashlets.

The Business Service Editor is used to manage and model the Business Services and their hierarchy. It is required to have administrative permissions and is available in "Login Name → Configure OpenNMS → Manage Business Services" in the Service Monitoring section.

Managing Business Services with the Business Service Editor

1. Create a new Business Service definition
2. Collapse tree view for all Business Services in the view
3. Expand tree view for all Business Services in the view
4. Reload all Business Services in the view with current Business Services from the system
5. Reload the Business Service Monitoring Daemon to use the Business Service definition as configured
6. Business Service dependency hierarchy as tree view
7. Show the current Business Service with dependencies in the Topology UI
8. Edit and delete existing Business Service definitions

As shown in figure Managing Business Services with the Business Service Editor the Business Services can be created or changed. The hierarchy is created by assigning an existing Business Service as Child Service.

12.8. Edges

Edges map the Alarm status monitoring with OpenNMS

The following types can be used:
- **Child Service**: A reference to an existing *Business Service* on which to depend

- **IP Service**: A convenient way to refer to the alarms that can be generated by a monitored *IP Service*. This will automatically provide edges for the *nodeLostService*, *interfaceDown* and *nodeDown* reduction keys of the specified service.

- **Reduction Key**: A resolved *Reduction Key* used to refer to a specific *Alarm*, e.g. generated by a *SNMP Trap* or *Threshold* violation

- **Application**: A reference to an existing application. This will automatically provide edges for the *nodeLostService*, *interfaceDown* and *nodeDown* reduction keys of the specified service.

If you need help determining the reduction key used by an alarm, trigger the alarm in question and pull the reduction key from the *Alarm* details page.

All edge types have the following parameters:

- **Map Function**: The associated *Map Function* for this *Edge*

- **Weight**: The relative *Weight* of this edge. Used by certain *Reduce Functions*.

Both *IP Service* and *Reduction Key* type edges also support a *Friendly Name* parameter which gives the user control on how the edge is labeled in the *Topology User Interface*. The editor changing the *Edge* attributes is shown in figure **Editor to add Business Service Edges**.

**Editor to add Business Service Edges**

12.8.1. Child Services

To create a hierarchy of *Business Services* they need to be created first. The hierarchy is build by selecting the *Business Service* as Child Service as dependency.

12.8.2. IP Services

The *IP Service* is a predefined set of *Reduction Keys* which allows easily to assign a specific *Monitored Service* to the given *BS*. As an example you have multiple Servers with a *Monitored Service* SMTP and you want to model a *BS* named *Mail Communication*. If just the *Reduction Key* for a *nodeLostService* is assigned, the *BS* would not be affected in case the *IP Interface* or the whole *Node* goes down. *OpenNMS* generates *Alarms* with different *UEI* which needs to be assigned to the *BS* as well. To make it easier to model this use case the *IP Service* generates the following *Reduction*
Keys automatically:

- `uei.opennms.org/nodes/nodeLostService:%nodeId%:%ipAddress%:%serviceName%`: Matches *Alarms* when the given *Monitored Service* goes down
- `uei.opennms.org/nodes/interfaceDown:%nodeId%:%ipAddress%`: Matches *Alarms* when the given *IP Interface* of the *Monitored Service* goes down
- `uei.opennms.org/nodes/nodeDown:%nodeId%`: Matches *Alarms* when the given *Node* of the *Monitored Service* goes down

### 12.8.3. Custom Reduction Key

The *Reduction Key* edge is used to refer to specific instance of alarms. When an alarm with the given *Reduction Key* is present, the alarms’ severity will be used to calculate the *Operational Status* of the BS. To give a better explanation a *Friendly Name* can be set and is used in the *Business Service View*. The format of the *Reduction Key* is build by a set of attributes as a key separated by `:` and enclosed in `%`, i.e (``%attribute%:%attribute%``).

**Example of a Reduction Key for a specific nodeLostService**

```
%uei.opennms.org/nodes/nodeLostService%:%nodeId%:%ipAddress%:%serviceName%
```

### 12.8.4. Application

Already defined *Applications* can be used in *Business Service* topologies. An *Application* itself defines a set of *Monitored Services* - each of these generate *nodeLostService, interfaceDown* and *nodeDown* reduction keys automatically.

### 12.9. Map Functions

The *Map Functions* define how the *Severity* of the edge will be used in the *Reduce Function* of the parent when calculating the *Operational Status*.

The available *Map Functions* are:

**Table 107. Calculation of the Operational Status with Map Functions**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity</td>
<td>Use the same <em>Severity</em> as <em>Operational Status</em> of the BS</td>
</tr>
<tr>
<td>Increase</td>
<td>Increase the <em>Severity</em> by one level and use it as <em>Operational Status</em> of the BS</td>
</tr>
<tr>
<td>Decrease</td>
<td>Decrease the <em>Severity</em> by one level and use it as <em>Operational Status</em> of the BS</td>
</tr>
<tr>
<td>SetTo</td>
<td>Set the <em>Operational Status</em> to a constant <em>Severity</em> value</td>
</tr>
<tr>
<td>Ignore</td>
<td>The input of the <em>Edge</em> is ignored for <em>Operational Status</em> calculation</td>
</tr>
</tbody>
</table>
12.10. Reduce Functions

A Reduce Function is used to aggregate the Operational Status for the BS. The Alarm Severity from the Edges are used as input for the Reduce Function. For this operation the following Reduce Functions are available:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Highest Severity</td>
<td>Uses the value of the highest severity, Weight is ignored.</td>
</tr>
<tr>
<td>Threshold</td>
<td>Uses the highest severity found more often than the given threshold, e.g. 0.26 can also be seen as 26%, which means at least 2 of 4 Alarms need to be raised to change the BS.</td>
</tr>
<tr>
<td>Highest Severity Above</td>
<td>Uses the highest severity greater than the given threshold severity.</td>
</tr>
</tbody>
</table>
### Exponential Propagation

This reduce function computes the sum of the given child severities based on a base number. For this computation the severities are mapped to numbers:

- **WARNING** = 0, **MINOR** = 1, **MAJOR** = 2, **CRITICAL** = 3

All other severities are ignored.

For the aggregation the following formula will be used to compute the resulting Business Service severity from its \( n \) child entities based on the base number \( b \):

\[
\text{severity} = \left\lfloor \log_b \left( \sum_{i=1}^n b^{\text{childSeverity}_i} \right) \right\rfloor
\]

In summary the base value defines how many items of a severity \( x \) will result in a severity \( x+1 \). Results lower as 0 are treated as **NORMAL** and results higher than 3 are treated as **CRITICAL**. If all input values are of severity **INDETERMINATE**, the result is **INDETERMINATE**.

For example if the Business Service depends on four child entities with the severities **WARNING**, **WARNING**, **NORMAL** and **NORMAL** and the base defined by the number 2 the following computation will be made:

\[
\text{severity} = \left\lfloor \log_2 \left( 2^0 + 2^0 + 0 + 0 \right) \right\rfloor = \left\lfloor \log_2 (1 + 1 + 0 + 0) \right\rfloor = \left\lfloor \log_2 (2) \right\rfloor = \left\lfloor 1 \right\rfloor = 1
\]

which corresponds to the severity **MINOR**. The same computation with the base value of 3 results in:

\[
\text{severity} = \left\lfloor \log_3 \left( 3^0 + 3^0 + 0 + 0 \right) \right\rfloor = \left\lfloor \log_3 (1 + 1 + 0 + 0) \right\rfloor = \left\lfloor \log_3 (2) \right\rfloor = \left\lfloor 0.63 \right\rfloor = 0
\]

which means **WARNING**.

The following table shows the status calculation with *Edges* assigned to an *IP Service*. The *IP-Service* is driven by the monitoring of the *ICMP* service for three Web Server. In the table below you find a configuration where *Web Server 3* is weighted 3 times higher than the other and a threshold of 0.33 (33%) is configured.

**Table 109. Example for status calculation using the Threshold function**

<table>
<thead>
<tr>
<th>Name</th>
<th>Weight</th>
<th>Weight Factor</th>
<th>Input Severity</th>
<th>Operational Status</th>
<th>Critical</th>
<th>Major</th>
<th>Minor</th>
<th>Warning</th>
<th>Normal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web-ICMP-1</td>
<td>1</td>
<td>0.2</td>
<td>Critical</td>
<td>Critical</td>
<td>0.2</td>
<td>0.2</td>
<td>0.2</td>
<td>0.2</td>
<td>0.2</td>
</tr>
<tr>
<td>Name</td>
<td>Weight</td>
<td>Weight Factor</td>
<td>Input Severity</td>
<td>Operational Status</td>
<td>Critical</td>
<td>Major</td>
<td>Minor</td>
<td>Warning</td>
<td>Normal</td>
</tr>
<tr>
<td>-----------</td>
<td>--------</td>
<td>---------------</td>
<td>----------------</td>
<td>--------------------</td>
<td>----------</td>
<td>-------</td>
<td>-------</td>
<td>---------</td>
<td>--------</td>
</tr>
<tr>
<td>Web-ICMP-2</td>
<td>1</td>
<td>0.2</td>
<td>Normal</td>
<td>Normal</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0.2</td>
</tr>
<tr>
<td>Web-ICMP-3</td>
<td>3</td>
<td>0.6</td>
<td>Warning</td>
<td>Warning</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0.6</td>
<td>0.6</td>
</tr>
<tr>
<td>Total</td>
<td>1.0</td>
<td></td>
<td></td>
<td></td>
<td>0.2</td>
<td>0.2</td>
<td>0.2</td>
<td>0.8</td>
<td>1</td>
</tr>
<tr>
<td>Percentage</td>
<td>100%</td>
<td></td>
<td></td>
<td></td>
<td>20%</td>
<td>20%</td>
<td>20%</td>
<td>80%</td>
<td>100%</td>
</tr>
</tbody>
</table>

The *Operational Status Severity* is evaluated from left to right, the first value higher than the configured *Threshold* is used. In this case the *Operational Status* is set to *Warning* because the first threshold which exceeds 33% is *Warning* with 80%.

### 12.11. Business Service Daemon

The calculation of the *Operational Status* of the BS is driven by the *Business Service Monitoring Daemon* (bsmd). The daemon is responsible for tracking the operational status of all BS and for sending events in case of operational status changes.

In order to calculate the *Operational Status* the *reduction key* associated with a *Business Service* is used. The *reduction key* is obtained from an alarm generated by *OpenNMS Horizon*. This means that the alarm’s *reduction key* of a defined *Business Service* must not change afterwards. Otherwise bsmd is not able to calculate the *Operational Status* correctly. This also applies for removing the *alarm data* from events associated to *Business Services*. In addition the child type "IP Service" from the *Business Service Configuration Page* requires the following events with the default reduction keys being defined: * uei.opennms.org/nodes/nodeLostService * uei.opennms.org/nodes/nodeDown * uei.opennms.org/nodes/interfaceDown

Every time the configuration of a *Business Service* is changed a reload of the daemon’s configuration is required. This includes changes like the name of the *Business Service* or its attributes as well as changes regarding the *Reduction Keys*, contained *Business Services* or *IP Services*. The bsmd configuration can be reloaded with the following mechanisms:

- Click the *Reload Daemon* button in the *Business Service Editor*
- Send the *reloadDaemonConfig* event using *send-event.pl* or use the WebUI in *Manually Send an Event* with parameter *daemonName* bsmd
- Use the ReST API to perform a *POST* request to `/opennms/api/v2/business-services/daemon/reload`

If the reload of the configuration is done an event of type *uei.opennms.org/internal/reloadDaemonConfigSuccessful* is fired.
Example reloading bsmd configuration from CLI

$OPENNMS_HOME/bin/send-event.pl -p 'daemonName bsmd'
uei.opennms.org/internal/reloadDaemonConfig

Example reloading bsmd configuration through ReST POST

Chapter 13. Topology Map

This section describes how to configure the Topology Map.

13.1. Properties

The Topology Map supports the following properties, which can be influenced by changing the file etc/org.opennms.features.topology.app.cfg:

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>showHeader</td>
<td>Boolean</td>
<td>true</td>
<td>Defines if the OpenNMS Horizon header is shown.</td>
</tr>
<tr>
<td>autoRefresh.enabled</td>
<td>Boolean</td>
<td>false</td>
<td>If enabled, auto refresh is enabled by default.</td>
</tr>
<tr>
<td>autoRefresh.interval</td>
<td>Integer</td>
<td>60</td>
<td>Defines the auto refresh interval in seconds.</td>
</tr>
<tr>
<td>hiddenCategoryPrefix</td>
<td>String</td>
<td>empty String</td>
<td>A String which allows hiding categories. For example a value of server will hide all categories starting with server. Be aware, that this setting is case-sensitive, so Servers will be shown. The resolution is only enabled if no longitude/latitude information is available.</td>
</tr>
</tbody>
</table>

13.2. Icons

Each Vertex on the Topology Map is represented by an icon. The default icon is configured in the icon mapping file: ${OPENNMS_HOME}/etc/org.opennms.features.topology.app.icons.<topology-namespace>.cfg. If an icon mapping file does not exist for a Topology Provider, the provider does not support customization.

List of available icon mapping files (may not be complete)

- org.opennms.features.topology.app.icons.default.cfg ①
- org.opennms.features.topology.app.icons.application.cfg ②
- org.opennms.features.topology.app.icons.bsm.cfg ③
- org.opennms.features.topology.app.icons.linkd.cfg ④
- org.opennms.features.topology.app.icons.vmware.cfg ⑤

① Default icon mapping
② Icon mapping for the Application Topology Provider
③ Icon mapping for the Business Services Topology Provider
④ Icon mapping for the Linkd Topology Provider
⑤ Icon mapping for the Vmware Topology Provider

Each File contains a mapping in form of <icon key> = <icon id>.
Icon key

A Topology Provider dependent string which maps to an icon id. An icon key consists of one to multiple segments. Each segment must contain only numbers or characters. If multiple segments exist they must be separated by ., e.g. my.custom.key. Any existing default icon keys are not configurable and should not be changed.

Icon id

The icon id is a unique icon identifier to reference an icon within one of the available SVG icons located in ${OPENNMS_HOME}/jetty-webapps/opennms/svg. For more details see Add new icons.

Icon key and icon id specification using BNF

```
icon key ::= segment\[\"segment\]*
segment ::= text+ [( "\" - " | ") text]*
text ::= (char | number)+
char ::= A | B | ... | Z | a | b | ... | z
number ::= 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9
icon id ::= segment
```

Example icon mapping file

```
# Business Service Topology
bsm.business-service = business_service ①
bsm.ip-service = IP_service ②
bsm.reduction-key = reduction_key ③
```

① Icon definition for Business Services
② Icon definition for IP Services
③ Icon definition for Reduction Keys

13.2.1. Icon resolution

The icon of a vertex is resolved as follows:

- If a vertex id to icon id mapping is defined, the icon referenced by the icon id is used
- If a mapping for the icon key determined by the Topology Provider for the vertex is defined, the icon referenced by the icon id is used
  - If no mapping exists and the icon key has more than one segments, reduce the icon key by the last segment and try resolving that icon key
- If no mapping is defined, the fallback icon key default is used.

The following example icon mapping is defined for the Linkd Topology Provider to illustrate this behaviour.

```
linkd.system.snmp.1.3.6.1.4.1.9.1.485 = server1
linkd.system.snmp.1.3.6 = server2
```
If the Enterprise OID of a node is \texttt{1.3.6.1.4.1.9.1.485} the icon with id \texttt{server1} is used. If the Enterprise OID of a node is \texttt{1.3.6} the icon with id \texttt{server2} is used. However, if the Enterprise OID of a node is \texttt{1.3.6.1.4.1.9.1.13} the icon with id \texttt{server2} is used.

\textbf{Linkd Topology Provider}

The \textit{Linkd Topology Provider} uses the Enterprise OID from each node to determine the icon of a vertex.

\textbf{13.2.2. Change existing icon mappings}

The easiest way to change an icon representation of an existing Vertex is to use the \textit{Icon Selection Dialog} from the Vertex' context menu in the Topology Map. This will create a custom icon key to icon id mapping in the \textit{Topology Provider} specific icon mapping file. As icon key the Vertex id is used. This allows each Vertex to have it's own icon.

If a more generic approach is preferred the icon mapping file can be modified manually.

\begin{table}[h]
\centering
\begin{tabular}{|l|l|}
\hline
\textbf{Warning} & Do NOT remove the default mappings and do NOT change the icon keys in the default mappings. \\
\hline
\end{tabular}
\end{table}

\textbf{13.2.3. Add new icons}

All available icons are stored in SVG files located in \texttt{$\{OPENNMS\_HOME\}/jetty-webapps/opennms/svg}. To add new icons, either add definitions to an existing SVG file or create a new SVG file in that directory.

Whatever way new icons are added to OpenNMS it is important that each new icon id describes a set of icons, rather than a single icon. The following example illustrates this.

\textit{Example SVG file with a custom icon with id my-custom}

\begin{verbatim}
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE svg PUBLIC "-//W3C//DTD SVG 1.1//EN"
"http://www.w3.org/Graphics/SVG/1.1/DTD/svg11.dtd">
<svg id="icons" xmlns="http://www.w3.org/2000/svg">
  <g id="my-custom_icon"> ①
    <g id="my-custom_active"> ②
      <!-- rect, path, circle, etc elements, supported by SVG -->
    </g>
    <g id="my-custom_rollover"> ③
      <!-- rect, path, circle, etc elements, supported by SVG -->
    </g>
    <g id="my-custom"> ④
      <!-- rect, path, circle, etc elements, supported by SVG -->
    </g>
  </g>
  <!-- Additional groups ... -->
</svg>
\end{verbatim}
① Each icon must be in a SVG group with the id `<icon id>_icon`. Each SVG `<icon id>_icon` group must contain three sub groups with the ids: `<icon id>_active`, `<icon id>_rollover` and `<icon id>`.

② The icon to use when the Vertex is selected.

③ The icon to use when the Vertex is moused over.

④ The icon to use when the Vertex is not selected or not moused over (just visible).

```
<table>
<thead>
<tr>
<th>Access Gateway ①</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accesspoint</td>
</tr>
<tr>
<td>Cloud</td>
</tr>
<tr>
<td>Fileserver</td>
</tr>
<tr>
<td>Linux File Server</td>
</tr>
<tr>
<td>Opennms Server</td>
</tr>
<tr>
<td>Printer</td>
</tr>
<tr>
<td>Router</td>
</tr>
<tr>
<td>Workgroup Switch</td>
</tr>
<tr>
<td>My-custom ②</td>
</tr>
</tbody>
</table>
```

① Already existing icon ids

② New icon id

It is important that each `icon id` is unique overall SVG files. This means there cannot be another `my-custom` icon id in any other SVG file.

If the new icons should be selectable from the *Topology Map's Icon Selection Dialog* an entry with the new `icon id` must be added to the file `${OPENNMS_HOME}/etc/org.opennms.features.topology.app.icons.properties`.

**Snippet of `org.opennms.features.topology.app.icons.list`**

```
access_gateway ①
accesspoint
cloud
fileserver
linux_file_server
opennms_server
printer
router
workgroup_switch
my-custom ②
```

① Already existing icon ids

② New icon id

The order of the entries in `org.opennms.features.topology.app.icons.list` determine the order in the *Icon Selection Dialog* in the *Topology Map*. 
Chapter 14. Asset Topology Provider

14.1. Overview

OpenNMS Horizon has introduced the ability for users to define arbitrarily complex layered topologies using GraphML (see http://graphml.graphdrawing.org/). The details of how OpenNMS Horizon interprets GraphML are given in the GraphML section of the OpenNMS Horizon developers guide. The ability to display complex layered topologies is a great feature but creating a usable GraphML topology for a large network can be a complex task for a user.

The Asset Topology Provider avoids the need for users to work directly with GraphML by directly generating a layered GraphML topology based upon node parameters and the contents of the Node Asset table. The Asset Topology Provider greatly simplifies the task for many use cases by allowing users to define fields in the Node Asset table which will enable nodes to be positioned correctly in a complex topology. This allows a physical and logical ordering of nodes which makes it easier for users to represent and navigate their infrastructure.

The structure of the generated topology is determined by the assetLayers configuration constant which can be set by a user. To illustrate how this works, we will consider the following configuration:

```
assetLayers=asset-region,asset-building
```

The OpenNMS Horizon Asset table is parsed to generate nested layers in the order of the comma separated keys in the assetLayers property. Each layer is a graph which is named after the key. Graph nodes in each layer reference related Graph nodes in the underlying layer. The lowest layer contains Graph nodes which are directly linked to monitored OpenNMS Horizon nodes which have entries in the Asset table.

The following diagram shows the structure of a topology generated by the above assetLayers property
In this example the region asset fields for node 1, 2, 3, 4 are set to north. All of these nodes are in the same north region. The building asset fields for Node 1 and Node 2 are set to 21 (both nodes are in building 21) while the building asset fields for Node 3 and Node 4 are set to 22 (both nodes are in building 22).

The Asset Topology Provider generates four linked graphs for this configuration. The layer 0 graph is called asset-region, the layer 1 graph is called asset-building and the layer 2 graph is called nodes.

Conceptually we can see that the topology is rendered as concentric sets. The Asset Topology Provider first searches all of the nodes with regions defined and creates a new level 0 graph node representing each region found. The Asset Topology Provider then searches within each region to find the building entries and creates a corresponding level 1 graph node for each building name found. Finally the Asset Topology Provider creates layer 2 nodes corresponding to each OpenNMS Horizon monitored node and places each in the correct building.

If however OpenNMS Horizon monitored nodes are found which have either the region or building asset fields empty they cannot be placed correctly in this topology. These nodes as shown in the diagram as unallocated nodes. Finally, only building and region nodes are generated which can be linked to OpenNMS Horizon nodes in the topology. The Asset Topology Provider does not generate spurious graph nodes in upper layers which are not directly and completely referenced by OpenNMS Horizon nodes in the lowest layer.

Example screenshots of a topology containing regions, buildings, racks and nodes are shown below.
14.2. Asset layers

The entries for assetLayers can be any node or asset entry from the following list (defined in class NodeParamLabels). Keys beginning with node- come from the node table. Keys beginning with parent- come from the node table entry of the designated parent node (if defined). Keys beginning with asset- come from the corresponding asset table entry for the given node (if defined).

<table>
<thead>
<tr>
<th>node-nodelabel</th>
<th>node-nodeid</th>
<th>node-foreignsource</th>
<th>node-foreignid</th>
<th>node-nodesysname</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-nodesyslocation</td>
<td>node-operatingsystem</td>
<td>node-categories</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
This allows arbitrary topologies to be generated including physical fields (room, rack etc.) and logical fields such as asset node categories. Please note you should not put any spaces in the comma separated assetLayers list. If the assetLayers property is defined as empty then a single graph layer will be generated containing all opennms nodes.

### 14.3. Node filtering

In many cases it is desirable to control which nodes are included or excluded from a topology. For instance it is useful to be able to generate customised topologies for specific customers which include only regions/buildings etc relevant to their filtered node set. To this end it is possible to define a node filter which chooses which nodes are included in a generated topology.

Filters are defined using the same asset table keys which are available for the assetLayers field.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Definition</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>OR</td>
<td>key1=value1,value2 alternatively key1=value1;key1=value2</td>
<td>asset-region=north,south</td>
</tr>
<tr>
<td>AND</td>
<td>key1=val1;key2=val2</td>
<td>asset-region=north;asset-building=23</td>
</tr>
<tr>
<td>NOT</td>
<td>key1=!val1</td>
<td>asset-building=!23</td>
</tr>
</tbody>
</table>

Thus the following configuration means include only nodes with region north or south but exclude all nodes with building 23.

```plaintext
filter=asset-region=north,south;asset-building=!23
```
The filters are designed to treat all selected text key entries as comma separated values (csv). This allows OpenNMS node-categories which are many to many entries to be dealt with as a comma separated list of values; routers, servers, web etc. Thus we can select based on multiple separate node categories. The following configuration means show routers and servers on all buildings except building 23.

```plaintext
filter=node-categories=routers,servers;asset-building=!23
```

The filters treat all asset table entries as comma separated variables (csv). This also means that, for instance asset-displaycategory could also contain several values separated by commas. e.g. customer1, customer2, customer3 etc.

You should make sure asset addresses and other free format asset text fields do not contain commas if you want an exact match on the whole field

Regular expressions are also allowed. Regular expressions start with the ~ character. You can also negate a regular expression by preceding it with !~.

The following example will match against regions 'Stuttgart' and 'Isengard' and any building name which ends in 4

```plaintext
filter=asset-region=~.*gar(t|d);asset-building=~.*4
```

### 14.4. Configuration

The Asset Topology Provider persists both the asset topology graph definitions and the generated GraphML graphs. The persisted definitions mean that it is possible to regenerate graphs if the asset table is changed without reentering the configuration.

The Asset Topology Provider persists GraphML graphs along side any other GraphML graphs in the directory;

```
<opennms home>/etc/graphml
```

Please note that if you are using ReST or any other means to generate other GraphML graphs, you should ensure that the providerIds and labels are distinct from those used by the Asset Topology Provider.

The asset graph definitions for the Asset Topology Provider are persisted to the following xml configuration file:

```
<opennms home>/etc/org.opennms.features.topology.plugins.topo.asset.xml
```

Normally you should not edit this file directly but use the karaf consol or events to define new
The config file will contain each of the graph definitions as properties in the form

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<configs>
  <config>
    <label>Asset Topology Provider</label>
    <breadcrumb-strategy>SHORTEST_PATH_TO_ROOT</breadcrumb-strategy>
    <provider-id>asset</provider-id>
    <preferred-layout>Grid Layout</preferred-layout>
    <filters>
      <filter>asset-region=South</filter>
    </filters>
    <layers>
      <layer>asset-region</layer>
      <layer>asset-building</layer>
      <layer>asset-rack</layer>
    </layers>
  </config>
</configs>
```

The individual definition parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>providerId</td>
<td>The unique name of the provider - used as handle to install and remove the topology</td>
</tr>
<tr>
<td>label</td>
<td>The name which shows up on the topology menu (must be unique)</td>
</tr>
<tr>
<td>assetLayers</td>
<td>List of asset layers (in order). See separate description.</td>
</tr>
<tr>
<td>filters</td>
<td>List of filters to be applied. Filters determine which nodes are included in graph. See separate description.</td>
</tr>
<tr>
<td>preferredLayout</td>
<td>Preferred layout of the nodes in generated graphs.</td>
</tr>
<tr>
<td>breadcrumbStrategy</td>
<td>Breadcrumb strategy used to display breadcrumbs above each graph</td>
</tr>
</tbody>
</table>

### 14.5. Creating Asset Based Topologies From Karaf Consol

The *OpenNMS Horizon* Karaf Consol can be used to control topology generation. To login use admin password.

```bash
ssh admin@localhost -p 8101
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>opennms:asset-topo-create</td>
<td>Creates Asset Topology.</td>
<td>(The default settings are used if a particular setting is not included in the command)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>-l, --label : Asset Topology label (shows in topology menu) (Default: asset)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>-i, --providerId : Unique providerId of asset topology (Default: 'AssetTopologyProvider')</td>
</tr>
<tr>
<td></td>
<td></td>
<td>-f, --filter : Optional node filter (Default: empty filter i.e. allow all nodes)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>-a, --assetLayers : Comma separated list of asset layers (Default: asset-region,asset-building,asset-rack)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>-p, --preferredLayout : Preferred Layout (Default: 'Grid Layout')</td>
</tr>
<tr>
<td></td>
<td></td>
<td>-b, --breadcrumbStrategy : Bread Crumb Strategy (Default: SHORTEST_PATH_TO_ROOT)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If you simply type asset-topology:create a default topology with providerId asset will be created.</td>
</tr>
<tr>
<td>opennms:asset-topo-remove</td>
<td>Removes Asset Topology.</td>
<td>-i, --providerId : Unique providerId of asset topology (Default: asset)</td>
</tr>
<tr>
<td>opennms:asset-topo-list</td>
<td>Lists all Asset Topologies installed.</td>
<td>all : display detailed view including --uriParams string</td>
</tr>
<tr>
<td>opennms:asset-topo-regenerate</td>
<td>Regenerates the graphs for the given Asset Topology definition.</td>
<td>-i, --providerId : Unique providerId of asset topology to regenerate (Default: asset)</td>
</tr>
<tr>
<td>opennms:asset-topo-regenerateall</td>
<td>Best Effort regeneration of all asset topologies. (If one graph fails, the command will try to complete the rest of the definitions definition)</td>
<td></td>
</tr>
</tbody>
</table>

348
14.6. Creating Asset Based Topologies Using *OpenNMS Horizon* events

The *Asset Topology Provider* listens for events which trigger the generation and installation or removal of topologies. The *Asset Topology Provider* events are defined in the file

```
<opennms home>/etc/events/GraphMLAssetPluginEvents.xml
```

These events will use the default parameters if parameters are not supplied

To create a new topology from the current OpenNMS inventory use

```
(for default topology)
sudo ./send-event.pl uei.opennms.plugins/assettopology/create localhost

(or with parameters)
sudo ./send-event.pl uei.opennms.plugins/assettopology/create localhost -p 'providerId test' -p 'label test' -p 'assetLayers asset-country,asset-city,asset-building'-->
```

other example possible parameters are
-p 'filters asset-displaycategory=!testDisplayCategory'
-p 'preferredLayout Grid Layout'
-p 'breadcrumbStrategy SHORTEST_PATH_TO_ROOT'

To uninstall an asset topology use

```
(for default topology providerId)
sudo ./send-event.pl uei.opennms.plugins/assettopology/remove localhost

(or with specific providerId)
sudo ./send-event.pl uei.opennms.plugins/assettopology/remove localhost -p 'providerId test'
```

To regenerate an existing asset topology use

```
(for default topology providerId)
sudo ./send-event.pl uei.opennms.plugins/assettopology/regenerate localhost

(or with specific providerId)
sudo ./send-event.pl uei.opennms.plugins/assettopology/regenerate localhost-p 'providerId test'
```

To regenerate all existing asset topologies use
14.7. Viewing the topology

If all goes well, having installed the topology, upon refreshing your screen, you should see a new topology display option in the OpenNMS Horizon topology page. The displayed name of this topology is given by the label field.

The label field need not be the same as the providerId which is used by the ReST api for the installation or removal of a topology. However the label field must be unique across all installed topologies.

It is possible to have several topologies installed which have been generated using different configurations. You simply need to ensure that the providerId and label field used for each installation command is different.

14.8. Additional notes

Please note you MUST first uninstall an OpenNMS Horizon graphml topology before installing a new one. You will also have to log out and log back into the UI in order to see the new topology file. If you uninstall a topology while viewing it, the UI will throw an error and you will also have to log out and back in to see the remaining topologies.
Chapter 15. Database Reports

Reporting on information from the OpenNMS Horizon monitoring system is important for strategical or operational decisions. Database reports give access to the embedded JasperReports engine and allow users to create and customize report templates. Run these reports on demand or on a predefined schedule within OpenNMS Horizon.

Originally database reports created reports working on data stored in the OpenNMS Horizon database only. This is no longer mandatory, performance data can also be used. Theoretically the reports do not need to be OpenNMS Horizon related.

The OpenNMS Horizon Report Engine allows the creation of various kinds of reports and also supports distributed report repositories. These features are not covered by this documentation. Only reports using JasperReports and Grafana dashboards are described here.

15.1. Overview

The OpenNMS Horizon Report Engine uses the JasperReport library to create reports in various output formats. Each report template must be a *.jrxml file. The OpenNMS Horizon Report Engine passes a JDBC Connection to the OpenNMS Horizon Database to each report on execution.

<table>
<thead>
<tr>
<th>Supported Output Formats</th>
<th>PDF, CSV</th>
</tr>
</thead>
<tbody>
<tr>
<td>JasperReport Version</td>
<td>6.3.0</td>
</tr>
</tbody>
</table>

Table 110. feature overview

For more details on how JasperReports works, please refer to the official documentation of Jaspersoft Studio.

15.2. Modify existing reports

All default OpenNMS Horizon reports are located in $OPENNMS_HOME/etc/report-templates. Each .jrxml file located there can be modified; the changes are applied the next time OpenNMS Horizon creates a report.

When a subreport has been modified, OpenNMS Horizon will detect a change based on the report’s lastModified time and will recompile the report. A compiled version of the report is represented by a .jasper file with the same name as the .jrxml file. Subreports are located in $OPENNMS_HOME/etc/report-templates/subreports.

If unsure, simply delete all .jasper files and OpenNMS Horizon will automatically compile the subreports if needed.
15.3. Add a custom report

To add a new JasperReport report to the Local OpenNMS Horizon Report Repository, do the following:

Create a new entry in the $OPENNMS_HOME/etc/database-reports.xml file.

```
<report
   id="MyReport" ①
display-name="My Report" ②
   online="true" ③
   report-service="jasperReportService" ④
description="This is an example description. It shows up in the web ui when creating an online report" ⑤
/>
```

① A unique identifier.
② The name of the report. Appears in the web UI.
③ Defines if this report can be executed on demand, otherwise only scheduling is possible.
④ The report service implementation to use. In most cases this is jasperReportService.
⑤ A description of the report. Appears in the web UI.

In addition, create a new entry in the $OPENNMS_HOME/etc/jasper-reports.xml file.

```
<report
   id="MyReport" ①
template="My-Report.jrxml" ②
eengine="jdbc" ③
/> ①
```

① The identifier defined in the previous step. This identifier must exist in $OPENNMS_HOME/etc/database-reports.xml.
② The name of the template. The template must be located in $OPENNMS_HOME/etc/report-templates.
③ The engine to use. It is either jdbc or null.

15.4. Usage of Jaspersoft Studio

When developing new reports, we recommended using the Jaspersoft Studio application. Download it here.

We recommend always using the same Jaspersoft Studio version that the OpenNMS Horizon JasperReport library uses. Currently OpenNMS Horizon uses version 6.3.0.
15.4.1. Connect to the OpenNMS Horizon Database

To actually create SQL statements against the OpenNMS Horizon database you must create a database Data Adapter. The official Jaspersoft Studio documentation and wiki cover how to do this.

15.4.2. Use Measurements Datasource and Helpers

To use the Measurements API you must add the Measurements Datasource library to the build path of JasperStudio. To do so, right click in the Project Explorer and select Configure Buildpath.

1. Switch to the Libraries tab.
2. Click Add External JARs and select the opennms-jasperstudio-extension-26.1.3-SNAPSHOT-jar-with-dependencies.jar file located in $OPENNMS_HOME/contrib/jasperstudio-extension.
3. Close the file selection dialog.
4. The Measurements Datasource and Helpers should now be available.
5. Go to the Dataset and Query Dialog in Jaspersoft Studio and select a language called measurement.
If the Read Fields functionality is not available, use the Data preview. Access to the Measurements API is possible using the connection parameters MEASUREMENT_URL, MEASUREMENT_USERNAME and MEASUREMENT_PASSWORD. The Supported Fields section gives more details.

15.5. Accessing Performance Data

Before OpenNMS Horizon 17 and OpenNMS Meridian 2016, it was possible to access the performance data stored in .rrd or .jrobin files directly by using the jrobin language extension provided by the RrdDataSource. This is no longer possible; you must use the Measurements Datasource.

To access performance data within reports, we created a custom Measurement Datasource that allows you to query the Measurements API and process the returned data in your reports. Please refer to the official Measurements API documentation on how to use the Measurements API.

When using the Measurements Datasource within a report a HTTP connection to the Measurements API is only established if the report is NOT running within OpenNMS Horizon, e.g. when used with Jaspersoft Studio.

To receive data from the Measurements API simply create a query as follows:
Sample queryString to receive data from the Measurements API

```xml
<query-request step="300000" start="$P{startDateTime}" end="$P{endDateTime}" maxrows="2000">
  <source aggregation="AVERAGE" label="IfInOctets" attribute="ifHCInOctets" transient="false" resourceId="node[$P{nodeId}].interfaceSnmp[$P{interface}]"/>
  <source aggregation="AVERAGE" label="IfOutOctets" attribute="ifHCOutOctets" transient="false" resourceId="node[$P{nodeId}].interfaceSnmp[$P{interface}]"/>
</query-request>
```

① The query language. In our case, measurement, but JasperReports supports a lot out of the box, such as sql, xpath, etc.

### 15.5.1. Fields

Each datasource should return a number of fields, which can be used in the report. The Measurement Datasource supports the following fields:

<table>
<thead>
<tr>
<th>Field name</th>
<th>Field type</th>
<th>Field description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;label&gt;</td>
<td>java.lang.Double</td>
<td>Each Source defined as transient=false can be used as a field. The name of the field is the label, e.g. IfInOctets</td>
</tr>
<tr>
<td>timestamp</td>
<td>java.util.Date</td>
<td>The timestamp of the sample.</td>
</tr>
<tr>
<td>step</td>
<td>java.lang.Long</td>
<td>The Step size of the Response. Returns the same value for all rows.</td>
</tr>
<tr>
<td>start</td>
<td>java.lang.Long</td>
<td>The Start timestamp in milliseconds of the Response. Returns the same value for all rows.</td>
</tr>
<tr>
<td>end</td>
<td>java.lang.Long</td>
<td>The End timestamp in milliseconds of the Response. Returns the same value for all rows.</td>
</tr>
</tbody>
</table>

For more details about the Response, please refer to the official Measurement API documentation.

### 15.5.2. Parameters

In addition to the queryString, the following JasperReports parameters are supported.
<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEASUREMENT_URL</td>
<td>yes</td>
<td>The URL of the Measurements API, e.g. <a href="http://localhost:8980/opennms/rest/measurements">http://localhost:8980/opennms/rest/measurements</a></td>
</tr>
<tr>
<td>MEASUREMENT_USERNAME</td>
<td>no</td>
<td>If authentication is required, specify the username, e.g. admin</td>
</tr>
<tr>
<td>MEASUREMENT_PASSWORD</td>
<td>no</td>
<td>If authentication is required, specify the password, e.g. admin</td>
</tr>
</tbody>
</table>

15.6. Disable Scheduler

In cases where the scheduler executing the reports must be disabled, set the system property opennms.report.scheduler.enabled to false. You can set this in `${OPENNMS_HOME}/etc/opennms.properties` or `${OPENNMS_HOME}/etc/opennms.properties.d/<my-properties-file>.properties`.

15.7. Helper methods

There are a few helper methods to help create reports in OpenNMS Horizon.

These helpers come with the Measurement Datasource.

Table 111. Supported helper methods
<table>
<thead>
<tr>
<th>Helper class</th>
<th>Helper Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>org.opennms.netmgt.jasper.helper.MeasurementsHelper</td>
<td>getNodeOrNodeSourceDescriptor</td>
<td>Generates a node source descriptor according to the input parameters. Either node[nodeId] or nodeSource[foreignSource:foreignId] is returned. nodeSource[foreignSource:foreignId] is only returned if foreignSource and foreignId are not empty and not null. Otherwise node[nodeId] is always returned.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>nodeId : String, the ID of the node</td>
</tr>
<tr>
<td></td>
<td></td>
<td>foreignSource : String, the foreign source of the node. May be null</td>
</tr>
<tr>
<td></td>
<td></td>
<td>foreignId : String, the foreign ID of the node. May be null</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For more details see Usage of the node source descriptor.</td>
</tr>
</tbody>
</table>
15.7.1. Usage of the node source descriptor

A node is addressed by a node source descriptor. The node source descriptor references the node either via the foreign source and foreign id or by the node id.

If store by foreign source is enabled addressing the node only via foreign source and foreign id is possible.

To make report creation easier, there is a helper method to create the node source descriptor.

For more information about store by foreign source, please see our Wiki.

The following example shows the usage of that helper.
Depending on the input parameters, you either get a node resource descriptor or a foreign source/foreign id resource descriptor.

15.7.2. Usage of the interface descriptor

An interfaceSnmp is addressed with the exact interface descriptor. To allow easy access to the interface descriptor we provide a helper tool. The following example shows the usage of that helper.

To get the appropriate interface descriptor depends on the input parameter.
15.7.3. Use HTTPS

To establish a secure connection to the Measurements API, you must import the public certificate of the running OpenNMS Horizon to the Java Trust Store. In addition, OpenNMS Horizon must be configured to use that Java Trust Store. Please follow the instructions in this chapter to setup the Java Trust Store correctly.

In addition please also set the property org.opennms.netmgt.jasper.measurement.ssl.enable in $OPENNMS_HOME/etc/opennms.properties to true to ensure that only secure connections are established.

If org.opennms.netmgt.jasper.measurement.ssl.enable is set to false an accidentally insecure connection can be established to the Measurements API location. An SSL secured connection can be established even if org.opennms.netmgt.jasper.measurement.ssl.enable is set to false.

15.8. Limitations

- Only a JDBC Datasource to the OpenNMS Horizon Database connection can be passed to a report, or no datasource at all. One does not have to use the datasource, though.

15.9. Creating PDF Reports from Grafana Dashboards Using OpenNMS Horizon

OpenNMS Horizon provides three templates to create a PDF report from an existing Grafana dashboard. You can also schedule and email these PDF reports to anyone:

- Keep staff without access to OpenNMS Horizon informed about network performance for improved capacity planning
- Create a permanent record of strategic information and progress over a long period of time

The PDF report displays each of the panels from the specified dashboard, with one, two, or four panels per page, depending on the selected template.

Dashboard to PDF:
15.9.1. Before You Begin

This feature requires OpenNMS Horizon and an instance of Grafana with at least one dashboard and panel. OpenNMS allows you to create a report for any Grafana dashboard, not just those created using OpenNMS Helm.

You must set up Grafana as a datasource by configuring the Grafana endpoint in OpenNMS Horizon.

15.9.2. Configure the Grafana Endpoint

Configuring the Grafana endpoint sets up Grafana as the datasource for the dashboards from which you create PDFs.

1. Login to your Grafana instance.
2. Choose Configuration > API Keys and click New API Key.
3. Specify a key name and “Viewer” role and click Add.
   a. Leave the time to live blank so that the key never expires.
4. Copy the key so that you can paste it into the OpenNMS Horizon UI.
   a. If desired, test the key using the Curl command provided in the API key dialog.
5. In OpenNMS, click **Please add a Grafana endpoint:**

Report Parameters

There is no Grafana Endpoint defined. Please add a Grafana Endpoint.

6. In the **Endpoint Configuration** screen click the plus sign on the right to add a new endpoint.

7. Fill in the information and click **Test Connection**.

8. Click **Create**.

You can now use OpenNMS Horizon to create PDF reports of Grafana dashboards.

### 15.9.3. Creating a PDF of a Grafana Dashboard

1. In the OpenNMS Horizon UI, choose **Reports > Database Reports**.

2. In the **Report Templates** area, click **Grafana Dashboard Report <Xppp>**, where `<Xppp>` represents the number of panels per page you want to display.

3. In the **Report Parameters** area, specify the appropriate information.
   a. Note that **Grafana Endpoint** is the datasource. Select a Grafana dashboard from the dropdown list.
   b. You can also specify CSV for report type.

4. Click **Create Report**.
   a. You are prompted to save the report locally or open it. The file is saved to a folder on the OpenNMS Horizon Server. It also appears in the UI in the **Persisted Reports** tab.

5. To send the report to someone, click **Deliver this report**.

6. Fill out the **Report Delivery Options**.
   a. If you select **Email report**, specify the recipient’s email address in the **Recipient** field. Separate multiple recipient emails with a comma.
   b. **Webhook** allows you to post the generated report to the specified URL.

7. Click **Deliver Report**.

8. To schedule the report for regular delivery, click **Schedule this report**.

9. Specify the report frequency (daily, days per week, etc.) and interval of the report.

10. Click **Schedule Report**.

Scheduled reports appear in the **Report Schedules** tab, where you can edit or delete them:
Chapter 16. Enhanced Linkd

Enhanced Linkd (Enlinkd) has been designed to discover connections between nodes using data generated by various link discovery protocols and accessible via SNMP. Enlinkd gathers this data on a regular interval and creates a snapshot of a device's neighbors from its perspective by SNMP Data Collectors. Enlinkd consolidate the collected Data by Bridge Domain Discovery and Topologies Updater.

Enlinkd-Bridge Domain Discovery use the data gathered by Bridge and IpNetToMedia collectors to provide Bridge Broadcast Domain layout. The Bridge Forwarding Table provided by the single nodes display information about mac address learned on which bridge port, this is what the Bridge consider a Connection: this is not very useful so Bridge Discovery will perform domain calculation to assign to every mac address the port where the device that holds it is effective connected (Or the known nearest bridge port).

Enlinkd-Updaters, for every supported discovery protocol, use the provided Topologies Update API to provide connections information to other OpenNMS service and daemon via OnmsTopologyDao. The provided topologies are used in topology-map and for sending TopologyMessage via Kafka Producer.

The connections discovered by Enlinkd collectors and by Bridge Domain Discovery are called Links. The term Link, within the context of Enlinkd, is not synonymous with the term “link” when used with respect to the network OSI Layer 2 domain, whereby a link only indicates a Layer 2 connection. A Link in context of Enlinkd is a more abstract concept and is used to describe any connection between two OpenNMS Horizon Nodes. These Links are discovered based on information provided by an agent’s understanding of connections at the OSI Layer 2, Layer 3, or other OSI layers.

The Topologies discovered by Enlinkd-Updaters are made of Vertices and Edges.

The following sections describe the Enlinkd daemon and its configuration. Additionally, the supported Link discovery implementations will be described as well as a list of the SNMP MIBs that the SNMP agents must expose in order for EnLinkd to gather Links between Nodes. FYI: Detailed information about a node’s connections (discovered Links) and supporting link data can be seen on the Node detail page within the OpenNMS Horizon Web-UI.

16.1. Enlinkd Daemon

Essentially each Enlinkd-Collector asks each device the following question: "What is the network topology from your point of view", this will provide local topology discovery features.

The Enlinkd-Discovery does attempt to discover bridge domain Links with the data coming from all collected Bridge Forwarding Tables.

The Enlinkd-Updaters does attempt to discover global OnmsTopology doing correlation with the data coming from all node discovered Links.

For large environments the behavior of Enlinkd can be configured. During the EnLink discovery process informational and error output is logged to a global log file.

The *Discovery* for bridge first start is scheduled at \( \text{initial\_sleep\_time} + \text{bridge\_topology\_interval} \). The *Updaters* first start are scheduled at \( 0L \). Configuration changes are applied by restarting OpenNMS and Enlinkd. It is also possible to send an Event to Enlinkd reloading the configuration. An Event can be sent on the CLI or the Web User Interface.

**Send configuration reload event on CLI**

```bash
cd $OPENNMS_HOME/bin
./send-event.pl uei.opennms.org/internal/reloadDaemonConfig --parm 'daemonName Enlinkd'
```

If multiple protocols are enabled, the links will be discovered for each enabled discovery protocol. The topology WebUI will visualize *Links* for each discovery protocol. For example if you start *CDP* and *LLDP* discovery, the WebUI will visualize a *CDP Link* and an *LLDP Link*.

### 16.2. Layer 2 Link Discovery

*Enlinkd* is able to discover *Layer 2* network links based on the following protocols:

- **Link Layer Discovery Protocol** (LLDP)
- **Cisco Discovery Protocol** (CDP)
- **Bridge Discovery** (Bridge)

This information are provided by *SNMP Agents* with appropriate *MIB support*. For this reason it is required to have a working *SNMP* configuration running. The following section describes the required *SNMP MIB* provided by the *SNMP agent* to allow the *Link Discovery*.
16.2.1. LLDP Discovery

The *Link Layer Discovery Protocol (LLDP)* is a vendor-neutral link layer protocol. It is used by network devices for advertising their identity, capabilities, and neighbors. *LLDP* performs functions similar to several proprietary protocols, such as the *Cisco Discovery Protocol (CDP)*, *Extreme Discovery Protocol*, *Foundry Discovery Protocol (FDP)*, *Nortel Discovery Protocol* (also known as *SONMP*), and *Microsoft’s Link Layer Topology Discovery (LLTD)*. 

Only nodes with a running *LLDP* process can be part of the link discovery. The data is similar to running a `show lldp neighbor` command on the device. Linux and Windows servers don’t have an *LLDP* process running by default and will not be part of the link discovery.

The following OIDs are supported to discover and build the *LLDP* network topology and are collected by the *LLDP Discovery Collector*.

**Table 114. Supported OIDs from LLDP-MIB**

Figure 36. Database tables related to LLDP discovery

**Lldp Topology Updater** provide LLDP OnmsTopology consolidating lldp data collected by **LLDP Collector** only full bidirectional connections between two Ldp supported devices become **Edges**. **Node A** and **Node B** are connected by an **LLDP Edge** if and only if there is an LLDP MIB port connection in **Node A** to **Node B** and viceversa.

### 16.2.2. CDP Discovery

The Cisco Discovery Protocol (CDP) is a proprietary link layer protocol from Cisco. It is used by network devices to advertise identity, capabilities and neighbors. CDP performs functions similar to several proprietary protocols, such as the Link Layer Discovery Protocol (LLDP), Extreme Discovery Protocol, Foundry Discovery Protocol (FDP), Nortel Discovery Protocol (also known as SONMP), and Microsoft’s Link Layer Topology Discovery (LLTD). The CDP discovery uses information provided by the CISCO-CDP-MIB and CISCO-VTP-MIB.

Only nodes with a running **CDP** process can be part of the link discovery. The data is similar to running a show cdp neighbor command on the IOS CLI of the device. Linux and Windows servers don’t have a **CDP** process running by default and will not be part of the link discovery.

The following OIDs are supported to discover and build the **CDP** network topology and are collected by the **CDP Discovery Collector**.

**Table 115. Supported OIDS from the IF-MIB**

</tr>
</tbody>
</table>

Generic information about the CDP process can be found in the CDP Information box on the Node Detail Page of the device. Information gathered from these OIDs will be stored in the following database table:
**Figure 37. Database tables related to CDP discovery**

**Cdp Topology Updater** provide CDP OnmsTopology consolidating cdp data collected by **CDP Collector** only full bidirectional connections between two Cdp supported devices become **Edges**. **Node A** and **Node B** are connected by an **CDP Edge** if and only if there is a CDP MIB port connection in **Node A** to **Node B** and vice versa.

### 16.2.3. Transparent Bridge Discovery

Discovering **Layer 2** network links using the **Bridge Forwarding** table requires a special algorithm. To discover **Links** an algorithm based on a scientific paper with the title **Topology Discovery for Large Ethernet Networks** is implemented. The gathered information is used to classify **Links** in **macLink** and **bridgeLink**. A **macLink** represents a **Link** between a workstation or server identified by a mac address. A **bridgeLink** is a connection between backbone ports. A **Shared Segment** is a connection among workstations or servers (several mac addresses) and backbone ports (for example devices connected via an hub). A **bridgeLink** is a a **shared segment** with only two bridge backbone ports. A **macLink** is a **shared segment** with only a bridge port and only one mac address. A **Broadcast Domain** is a collection of **Shared Segment** baed on common set of mac addresses.

**Discovery Bridge Broadcast Domains** is made in two step, the first step regards data collection. The Bridge Forwarding Table together with other Spanning Tree information is collected by the BridgeDiscovery Collector. The BTF is not persisted into database and is maintained in memory to be processed by the BridgeDomainDiscovery. **BridgeDomainDiscovery** runs the specified algorithm over collected BFT and will produce a Bridge Domain or several Bridge domains depending on the broadcasts set of mac addresses found. Bridge Domains are collection of Shared Segments as described above.

**BridgeDomainDiscovery** does not support multi vlan, the Bridge Network model identify a **Bridge** for every **VLAN**. Each VLAN has it's own Bridge Forwarding Table and it's own Spanning Tree. So in line to discovery a Bridge Topology the algorithm has to be run against every bridge and every vlan. Actually the discovery is run only against the main VLAN.

Bridge Domains provide no information about layer 3 but only a layer 2 two map of the Broadcast Domains. While Bridge/Switch are identified by the fact that are OpenNMS Nodes to map mac to
Nodes where possible the IpNetToMedia table is needed. In this manner we are able to associate to mac address the corresponding ip address and then the associated node. The Bridge Topology Updater put together the information stored into bridge domains with the ipnettomedia data. and provide Bridge OnmsTopology.

Bridge Topology Updater whenever possible tries to associate a mac address to an ip address and then to a node. It can happen that the mac address and the ip address specified are not associate to a single node (for example because there are duplicated node or also because the nodes supports protocol like LACP), in this case we do not resolve the node but leave the association found mac:ip into a specific Vertex.

Bridge Topology Updater do not support LACP protocols and other similar aggregation protocols.

Transparent bridging is not loop free so if you have loops you have to enable the spanning tree protocol that will detect loops and again will put some ports in a blocking state to avoid loops. To get links it is necessary to perform some calculations that let us define the Links. The following MIBS must be supported by the SNMP agent to allow Transparent Bridge Discovery.

Table 118. Supported MIBS from the Cisco-VTP MIB

<table>
<thead>
<tr>
<th>Name</th>
<th>OID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>.1.3.6.1.2.1.4.22.1.3</td>
<td>The IpAddress corresponding to the media-dependent physical address.</td>
</tr>
<tr>
<td>ipNetToMediaType</td>
<td>.1.3.6.1.2.1.4.22.1.4</td>
<td>The type of mapping. Setting this object to the value invalid(2) has the effect of invalidating the corresponding entry in the ipNetToMediaTypeTable. That is, it effectively disassociates the interface identified with said entry from the mapping identified with said entry. It is an implementation-specific matter as to whether the agent removes an invalidated entry from the table. Accordingly, management stations must be prepared to receive tabular information from agents that corresponds to entries not currently in use. Proper interpretation of such entries requires examination of the relevant ipNetToMediaType object.</td>
</tr>
</tbody>
</table>

Table 120. Supported OIDS from the BRIDGE-MIB

<td>.1.3.6.1.2.1.17.4.3.1.1</td>
<td>A unicast MAC address for which the bridge has forwarding and/or filtering information.</td>
</tr>
<tr>
<td>dot1dTpFdbPort</td>
<td>.1.3.6.1.2.1.17.4.3.1.2</td>
<td>Either the value '0', or the port number of the port on which a frame having a source address equal to the value of the corresponding instance of dot1dTpFdbAddress has been seen. A value of '0' indicates that the port number has not been learned but that the bridge does have some forwarding/filtering information about this address (e.g. in the dot1dStaticTable). Implementors are encouraged to assign the port value to this object whenever it is learned even for addresses for which the corresponding value of dot1dTpFdbStatus is not learned(3).</td>
</tr>
</tbody>
</table>
The status of this entry. The meanings of the values are:

- **other(1):** none of the following. This would include the case where some other MIB object (not the corresponding instance of `dot1dTpFdbPort`, nor an entry in the `dot1dStaticTable`) is being used to determine if and how frames addressed to the value of the corresponding instance of `dot1dTpFdbAddress` are being forwarded.

- **invalid(2):** this entry is not longer valid (e.g., it was learned but has since aged-out), but has not yet been flushed from the table.

- **learned(3):** the value of the corresponding instance of `dot1dTpFdbPort` was learned, and is being used.

- **self(4):** the value of the corresponding instance of `dot1dTpFdbAddress` represents one of the bridge’s addresses. The corresponding instance of `dot1dTpFdbPort` indicates which of the bridge’s ports has this address.

- **mgmt(5):** the value of the corresponding instance of `dot1dTpFdbAddress` is also the value of an existing instance of `dot1dStaticAddress`.

Generic information about the bridge link discovery process can be found in the *Bridge Information* box on the *Node Detail Page* of the device. Information gathered from this *OID* will be stored in the following database table:
16.3. Layer 3 Link Discovery

With Enlinkd it is possible to get Links based on network routing applications. The following routing daemons can be used to provide a discovery of links based Layer 3 information:

- Open Shortest Path First (OSPF)
- Intermediate System to Intermediate System (IS-IS)

This information is provided by SNMP Agents with appropriate MIB support. For this reason it is required to have a working SNMP configuration running. The link data discovered from Enlinkd is provided in the Topology User Interface and on the detail page of a node.
16.3.1. OSPF Discovery

The following MIBs are supported to discover and build the OSPF network topology and are collected by the OSPF Discovery Collector.

The relevant MIBs for OSPF topology are OSPF-MIB and OSPF-TRAP-MIB. In these MIBs are defined the relevant objects used to find OSPF links, specifically:

- The Router ID which, in OSPF, has the same format as an IP address
- But identifies the router independent of its IP address.

Also all the interfaces are identified by their IP addresses. The OSPF links come from the SNMP ospfNbrTable defined in OSPF-MIB and this table is in practice persisted in the ospfLink table:

Table 122. Supported OIDs from OSPF-MIB

<table>
<thead>
<tr>
<th>Name</th>
<th>OID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospfRouterId</td>
<td>.1.3.6.1.2.1.1 4.1.1.0</td>
<td>A 32-bit integer uniquely identifying the router in the Autonomous System. By convention, to ensure uniqueness, this should default to the value of one of the router's IP interface addresses. This object is persistent and when written the entity should save the change to non-volatile storage.</td>
</tr>
<tr>
<td>ospfAdminStat</td>
<td>.1.3.6.1.2.1.1 4.1.2.0</td>
<td>The administrative status of OSPF in the router. The value enabled denotes that the OSPF Process is active on at least one interface; disabled disables it on all interfaces. This object is persistent and when written the entity should save the change to non-volatile storage.</td>
</tr>
<tr>
<td>ospfVersionNum</td>
<td>.1.3.6.1.2.1.1 4.1.3.0</td>
<td>The current version number of the OSPF protocol is 2.</td>
</tr>
<tr>
<td>ospfAreaBdrRtrSta</td>
<td>.1.3.6.1.2.1.1 4.1.4.0</td>
<td>A flag to note whether this router is an Area Border Router.</td>
</tr>
<tr>
<td>ospfAreaASBdrRtrSta</td>
<td>.1.3.6.1.2.1.1 4.1.5.0</td>
<td>A flag to note whether this router is configured as an Autonomous System Border Router. This object is persistent and when written the entity should save the change to non-volatile storage.</td>
</tr>
<tr>
<td>ospfIfIpAddress</td>
<td>.1.3.6.1.2.1.1 4.7.1.1</td>
<td>The IP address of this OSPF interface.</td>
</tr>
<tr>
<td>ospfAddressLessIf</td>
<td>.1.3.6.1.2.1.1 4.7.1.2</td>
<td>For the purpose of easing the instancing of addressed and addressless interfaces; this variable takes the value 0 on interfaces with IP addresses and the corresponding value of ifIndex for interfaces having no IP address.</td>
</tr>
<tr>
<td>ospfNbrIpAddr</td>
<td>.1.3.6.1.2.1.1 4.10.1.1</td>
<td>The IP address this neighbor is using in its IP source address. Note that, on addressless links, this will not be 0.0.0.0 but the address of another of the neighbor’s interfaces.</td>
</tr>
</tbody>
</table>
Table 123. Supported OIDs from IP-MIB

<table>
<thead>
<tr>
<th>Name</th>
<th>OID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospfNbrAddressLessIndex</td>
<td>.1.3.6.1.2.1.1.4.10.1.2</td>
<td>On an interface having an IP address, zero. On addressless interfaces, the corresponding value of ifIndex in the Internet Standard MIB. On row creation, this can be derived from the instance.</td>
</tr>
<tr>
<td>ospfNbrRtrId</td>
<td>.1.3.6.1.2.1.1.4.10.1.3</td>
<td>A 32-bit integer (represented as a type IpAddress) uniquely identifying the neighboring router in the Autonomous System.</td>
</tr>
</tbody>
</table>

Generic information about the OSPF link discovery process can be found in the OSPF Information box on the Node Detail Page of the device. Information gathered from these OIDs will be stored in the following database table:

**Figure 39. Database tables related to OSPF discovery**

OSPF Topology Updater provide OSPF OnmsTopology consolidating OSPF data collected by OSPF Collector only full bidirectional connections between two OSPF supported devices become Edges. Node A and Node B are connected by an OSPF Edge if and only if there is a OSPF link in Node A to Node B and viceversa.
16.3.2. IS-IS Discovery

**IS-IS Links** are found in the *isisISAdjTable* that is defined in *ISIS-MIB* (mib-rfc4444.txt). In this table is found the information needed to find the Adjacency Intermediate System. The information about IS-IS is stored into two tables: *isisElement* and *isisLink*. *isisElement* contains the *ISISSysID*, a unique identifier of the "Intermediate System" (the name for the Router in ISO protocols). Each entry in this SNMP MIB table represents a unidirectional link from the *Intermediate System* that is queried to the *Adjacent Intermediate Systems* running IS-IS and "peering" with the source router. If two routers IS-A and IS-B support *ISIS-MIB*, then *EnLinkd* will create two link entries in OpenNMS Horizon: one from IS-A to IS-B (from the *adjTable* of IS-A) the complementary link back from IS-B to IS-A (from the *adjTable* of IS-B). IS-IS links are represented in the *ISIS-MIB* as follows:

The following OIDs are supported to discover and build the *ISIS* network topology and are collected by the *ISIS Discovery Collector*.

**Table 124. Supported OIDs from ISIS-MIB**

<table>
<thead>
<tr>
<th>Name</th>
<th>OID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>isisSysID</em></td>
<td>.1.3.6.1.2.1.138 .1.1.1.3.0</td>
<td>The ID for this Intermediate System. This value is appended to each of the area addresses to form the Network Entity Titles. The derivation of a value for this object is implementation specific. Some implementations may automatically assign values and not permit an SNMP write, while others may require the value to be set manually. Configured values <strong>must</strong> survive an agent reboot.</td>
</tr>
<tr>
<td><em>isisSysAdminStat</em></td>
<td>.1.3.6.1.2.1.138 .1.1.1.8.0</td>
<td>The administrative state of this Intermediate System. Setting this object to the value <strong>on</strong> when its current value is <strong>off</strong> enables the Intermediate System. Configured values <strong>must</strong> survive an agent reboot.</td>
</tr>
<tr>

<tr>
<td><em>isisISAdjNeighSysID</em></td>
<td>.1.3.6.1.2.1.138 .1.6.1.1.6</td>
<td>The system ID of the neighboring Intermediate System.</td>
</tr>
</tbody>
</table>
Generic information about the IS-IS link discovery process can be found in the IS-IS Information box on the Node Detail Page of the device. Information gathered from this OIDs will be stored in the following database table:

**Table:**

<table>
<thead>
<tr>
<th>Name</th>
<th>OID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>isisISAdjNbrExtendedCircID</td>
<td>.1.3.6.1.2.1.138 .1.6.1.1.7</td>
<td>The 4-byte Extended Circuit ID learned from the Neighbor during 3-way handshake, or 0.</td>
</tr>
</tbody>
</table>

**Figure 40. Database tables related to IS-IS discovery**

ISIS Topology Updater provide ISIS OnmsTopology consolidating Is-IS data collected by ISIS Collector only full bidirectional connections between two ISIS supported devices become Edges. Node A and Node B are connected by an ISIS Edge if and only if there is a ISIS link in Node A to Node B and viceversa.

Chapter 17. OpenTracing

17.1. Introduction

OpenTracing enables distributed tracing which makes it possible to monitor RPCs or transactions across process boundaries. This functionality can be leveraged to help track and diagnose communication problems that may arise in distributed deployments of OpenNMS Horizon that leverage Minion and/or Sentinel. OpenNMS Horizon currently supports Jaeger which implements the OpenTracing API.

OpenTracing is now supported on RPC calls between Minion and OpenNMS Horizon and Sink API calls (including flows) between Minion and Sentinel or OpenNMS Horizon.

17.1.1. Enabling Tracing on OpenNMS Horizon

By default the tracing instrumentation OpenNMS Horizon is disabled (a no-op tracer is used.)

Enable tracing with Jaeger as follows:

```bash
echo 'org.opennms.core.tracer=jaeger' >> "$OPENNMS_HOME/etc/opennms.properties.d/jaeger.properties"
echo 'opennms-core-tracing-jaeger' >> "$OPENNMS_HOME/etc/featuresBoot.d/jaeger.boot"
```

Restart OpenNMS Horizon to apply the changes.

Additional Jaeger tracing options can be added to the jaeger.properties file specified above. Available configuration options are listed here.

17.1.2. Enabling Tracing on Minion

Enable tracing with Jaeger on Minion by installing the opennms-core-tracing-jaeger feature.

```bash
echo 'opennms-core-tracing-jaeger' >> "$MINION_HOME/etc/featuresBoot.d/jaeger.boot"
```

Uninstalling the opennms-core-tracing-jaeger feature at runtime is not yet supported. To disable tracing with Jaeger, remove the reference from the features boot file and restart Minion.

Additional Jaeger tracing options can be added to $MINION_HOME/etc/system.properties on Minion. Available configuration options are listed here.

17.1.3. Enabling Tracing on Sentinel

Enable tracing with Jaeger on Sentinel by installing the opennms-core-tracing-jaeger feature.
Either `sentinel-flows` or `sentinel-telemetry` need to be installed before installing `opennms-core-tracing-jaeger` feature. Uninstalling the `opennms-core-tracing-jaeger` feature at runtime is not yet supported. To disable tracing with Jaeger, remove the reference from the features boot file and restart `Sentinel`.

Additional Jaeger tracing options can be added to `$SENTINEL_HOME/etc/system.properties` on `Sentinel`. Available configuration options are listed [here](#).
Chapter 18. Operation

18.1. HTTPS / SSL

This chapter covers the possibilities to configure OpenNMS Horizon to protect web sessions with HTTPS and also explains how to configure OpenNMS Horizon to establish secure connections.

In order to use HTTPS the Java command line tool keytool is used. It is automatically shipped with each JRE installation. More details about the keytool can be found at the official documentation.

18.1.1. Standalone HTTPS with Jetty

To configure OpenNMS Horizon to protect web sessions with HTTPS, see How to setup SSL with Jetty.

18.1.2. OpenNMS Horizon as HTTPS client

To establish secure HTTPS connections within Java one has to setup a so called Java Trust Store.

The Java Trust Store contains all certificates a Java application should trust when making connections as a client to a server.

Setup Java Trust Store

To setup the Java Trust Store the following command can be issued.

| ① | Define to import a certificate or a certificate chain |
| ② | Use verbose output |
| ③ | Define to trust certificates from cacerts |
| ④ | The alias for the certificate to import, e.g. the common name |
| ⑤ | The certificate to import |
| ⑥ | The location of the Java Trust Store |

Import a certificate to the Java Trust Store

keytool \
-import \ ①
-v \ ②
-trustcacerts \ ③
-alias localhost \ ④
-file localhost.cert \ ⑤
-keystore /$OPENNMS_HOME/etc/trust-store.jks \ ⑥
If you create a new Java Trust Store you are asked for a password to protect the Java Trust Store. If you update an already existing Java Trust Store please enter the password you chose when creating the Java Trust Store initially.

**Download existing public certificate**

To Download an existing public certificate the following command can be issued.

```
openssl s_client -showcerts -connect localhost:443 -servername localhost < /dev/null > localhost.cert
```

- Use SSL/TLS client functionality of openssl.
- Show all certificates in the chain
- PORT:HOST to connect to, e.g. localhost:443
- This is optional, but if you are serving multiple certificates under one single ip address you may define a server name, otherwise the ip of localhost:PORT certificate is returned which may not match the requested server name (mail.domain.com, opennms.domain.com, dns.domain.com)
- No input
- Where to store the certificate.

**Configure OpenNMS Horizon to use the defined Java Trust Store**

To setup OpenNMS Horizon to use the defined Java Trust Store the according javax.net.ssl.trustStore* properties have to be set. Open $OPENNMS_HOME/etc/opennms.properties and add the properties javax.net.ssl.trustStore and javax.net.ssl.trustStorePassword as shown below.

```
javax.net.ssl.trustStore=/$OPENNMS_HOME/etc/trust-store.jks
javax.net.ssl.trustStorePassword=change-me
```

- The location of the Java Trust Store
- The password of the Java Trust Store

For more details on the Java build-in SSL System properties have a look at chapter Debugging / Properties.

---

Each time you modify the Java Trust Store you have to restart OpenNMS Horizon to have the changes take effect.
18.1.3. Differences between *Java Trust Store* and *Java Key Store*

The *Java Trust Store* is used to determine whether a remote connection should be trusted or not, e.g. whether a remote party is who it claims to be (client use case).

The *Java Key Store* is used to decide which authentication credentials should be sent to the remote host for authentication during SSL handshake (server use case).

For more details, please check the [JSSE Reference Guide](#).

18.1.4. Debugging / Properties

If you encounter issues while using HTTPS it might be useful to enable debugging or use one of the build-in Java System Properties to configure the proper use of SSL.

*Table 125. Java build-in System Properties* *(Source)*

<table>
<thead>
<tr>
<th>System Property Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>javax.net.ssl.keyStore</code></td>
<td>Location of the Java keystore file containing an application process’s own certificate and private key. On Windows, the specified pathname must use forward slashes, <code>/</code>, in place of backslashes, <code>\</code>.</td>
</tr>
<tr>
<td><code>javax.net.ssl.keyStorePassword</code></td>
<td>Password to access the private key from the keystore file specified by <code>javax.net.ssl.keyStore</code>. This password is used twice: to unlock the keystore file (store password) and to decrypt the private key stored in the keystore (key password). In other words, the JSSE framework requires these passwords to be identical.</td>
</tr>
<tr>
<td><code>javax.net.ssl.keyStoreType</code></td>
<td><em>(Optional)</em> For Java keystore file format, this property has the value <code>jks</code> (or <code>JKS</code>). You do not normally specify this property, because its default value is already <code>jks</code>.</td>
</tr>
<tr>
<td><code>javax.net.ssl.trustStore</code></td>
<td>Location of the Java keystore file containing the collection of CA certificates trusted by this application process (trust store). On Windows, the specified pathname must use forward slashes, <code>/</code>, in place of backslashes, <code>\</code>. If a trust store location is not specified using this property, the Sun JSSE implementation searches for and uses a keystore file in the following locations (in order): $JAVA_HOME/lib/security/jssecacerts and $JAVA_HOME/lib/security/cacerts</td>
</tr>
</tbody>
</table>
### System Property Name

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>javax.net.ssl.trustStorePassword</code></td>
<td>Password to unlock the keystore file (store password) specified by <code>javax.net.ssl.trustStore</code>.</td>
</tr>
<tr>
<td><code>javax.net.ssl.trustStoreType</code></td>
<td>(Optional) For Java keystore file format, this property has the value <code>jks</code> (or <code>JKS</code>). You do not normally specify this property, because its default value is already <code>jks</code>.</td>
</tr>
<tr>
<td><code>javax.net.debug</code></td>
<td>To switch on logging for the SSL/TLS layer, set this property to <code>ssl</code>. More details about possible values can be found here.</td>
</tr>
</tbody>
</table>

### 18.2. Request Logging

HTTP requests logs for Jetty can be enabled by uncommenting the following snippet in `etc/jetty.xml`:

```xml
<!-- NCSA Request Logging
<Item>
  <New id="RequestLog" class="org.eclipse.jetty.server.handler.RequestLogHandler">
    <Set name="requestLog">
      <New id="RequestLogImpl" class="org.eclipse.jetty.server.NCSARequestLog">
        <Arg>logs/jetty-requests-yyyy_mm_dd.log</Arg>
        <Set name="retainDays">90</Set>
        <Set name="append">true</Set>
        <Set name="extended">true</Set>
        <Set name="logTimeZone">US/Central</Set>
      </New>
    </Set>
  </New>
</Item>

If you do not have a `jetty.xml` in the `etc` directory, you can start by copying the example from `etc/examples/jetty.xml`.

If you would like the include the usernames associated with the requests in the log file, you must also uncomment the following snippet in `jetty-webapps/opennms/WEB-INF/web.xml`:
After restarting *OpenNMS Horizon*, requests logs of the following form should be available in `logs/jetty-requests-*.*.log`:

```
127.0.0.1 - - [02/Jun/2017:09:16:38 -0500] "GET / HTTP/1.1" 302 0 "-" "Mozilla/5.0 (X11; Fedora; Linux x86_64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/58.0.3029.110 Safari/537.36"

```

### 18.3. Geocoder Service

The *Geocoder Service* is used to resolve geolocation information within *OpenNMS Horizon*. *OpenNMS Horizon* supports several *Geocoder Services*. By default geolocation resolution is disabled.

To enable or configure the *Geocoder Service* please use the web based configuration tool. This can be found in the administration section: Admin → Configure Geocoder Service

The currently used *Geocoder Service* is configured via the property `activeGeocoderId` in `etc/org.opennms.features.geocoder.cfg`.

#### 18.3.1. Google

The Google Geocoder API requires at least an `apiKey` or a `clientId` and `signature`. For more details please refer to the official documentation.

The following properties in `etc/org.opennms.features.geocoder.google.cfg` are supported:

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiKey</td>
<td>string</td>
<td>yes</td>
<td>empty string</td>
<td>Is only required if <code>useEnterpriseCredentials</code> is <code>false</code>. The <code>apiKey</code> provided by the Google Cloud Platform.</td>
</tr>
<tr>
<td>Property</td>
<td>Type</td>
<td>Required</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>----------</td>
<td>----------</td>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>useEnterpriseCredentials</td>
<td>Boolean</td>
<td>no</td>
<td>false</td>
<td>If authentication with clientId and signature is required, set this to true.</td>
</tr>
<tr>
<td>clientId</td>
<td>String</td>
<td>yes</td>
<td>empty string</td>
<td>Is only required if useEnterpriseCredentials is true The Google Geocoder API Client ID.</td>
</tr>
<tr>
<td>signature</td>
<td>String</td>
<td>yes</td>
<td>empty string</td>
<td>The Google Geocoder API Signature.</td>
</tr>
<tr>
<td>useSystemProxy</td>
<td>Boolean</td>
<td>no</td>
<td>false</td>
<td>Should the system wide proxy settings be used? The system proxy settings can be configured in opennms.conf</td>
</tr>
<tr>
<td>timeout</td>
<td>Integer</td>
<td>no</td>
<td>500</td>
<td>The connection timeout in milliseconds the Geocoder tries to resolve a single geolocation.</td>
</tr>
</tbody>
</table>

### 18.3.2. Mapquest
For more details please refer to the official documentation.

The following properties in `etc/org.opennms.features.geocoder.mapquest.cfg` are supported:

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiKey</td>
<td>String</td>
<td>yes</td>
<td>empty string</td>
<td>The apiKey.</td>
</tr>
<tr>
<td>url</td>
<td>String</td>
<td>yes</td>
<td><a href="http://www.mapquestapi.com/geocoding/v1/address?format=json&amp;key=%7BapiKey%7D&amp;maxResults=1&amp;location=%7Bquery%7D">http://www.mapquestapi.com/geocoding/v1/address?format=json&amp;key={apiKey}&amp;maxResults=1&amp;location={query}</a></td>
<td>The url template for the Mapquest Geocoder API. The {apiKey} and {query} strings are substituted before making the request.</td>
</tr>
<tr>
<td>useSystemProxy</td>
<td>Boolean</td>
<td>no</td>
<td>false</td>
<td>Should the system wide proxy settings be used? The system proxy settings can be configured in opennms.conf</td>
</tr>
</tbody>
</table>

### 18.3.3. Nominatim
For more details please refer to the official documentation and ensure to check out the Nominatim Usage Policy before using the Geocoder Service.

The following properties in `etc/org.opennms.features.geocoder.nominatim.cfg` are supported:
18.4. newts-repository-converter: Rrd/Jrb to Newts migration utility

This utility can be used to migrate existing RRDTool- or JRobin-based data to a Newts cluster. This will be achieved by traversing the share/rrd directory and its subdirectories, reading the data and properties files and persisting this data to Newts.

18.4.1. Migration

The following suggestions try to minimize the data collection gap that occur when reconfiguring OpenNMS Horizon for a different storage strategy. First, we determine the parameters needed for migration of the existing data. After that, we reconfigure OpenNMS Horizon to persists all new collected data to Newts storage. Finally, the Rrd- or JRobin-based data will be converted and persisted to Newts using the newts-repository-converter utility.
Prerequisites

• Working OpenNMS Horizon installation with RRDTool- or JRobin-based storage strategy configured.

• Installed and working Newts cluster reachable by the OpenNMS Horizon instance.

Migration plan

1. Check and write down the values for the following options in your opennms.properties file. You will need these information later to invoke the newts-repository-converter utility.
   a. File etc/opennms.properties:
      • Check for the entry org.opennms.rrd.storeByGroup whether storeByGroup is enabled.
      • Check for the entry rrd.base.dir for the location where Rrd or Jrb files are stored.
      • Check for the entry rrd.binary for the location of the RRDTool binary.

   b. File etc/rrd-configuration.properties:
      • Check for the entry org.opennms.rrd.strategyClass whether JRobinRrdStrategy (JRobin) or JniRrdStrategy/MultithreadedJniRrdStrategy (RRDTool) is used.

2. Stop your OpenNMS Horizon instance.

3. Reconfigure OpenNMS Horizon to persist data to Newts - so, when correctly configured all new samples will be persisted into Newts after OpenNMS Horizon is started. Note, that the converter assumes storeByForeignSource to be enabled.

4. Start your OpenNMS Horizon instance.

5. Use the newts-repository-converter utility to convert the existing data to Newts by specifying the options that correspond to the information gathered during step #1.

This procedure will minimize the data collection gap to the time needed to reconfigure OpenNMS Horizon for Newts storage.

The newts_converter utility needs the path to the base directory of your OpenNMS Horizon instance for reading the configuration files. For instance the utility needs the datasource configuration during the migration process to query the database to lookup node data.

18.4.2. Usage

The utility is installed by default and its wrapper script is located in the ${OPENNMS_HOME}/bin directory.

$ cd /path/to/opennms/bin
$ ./newts-repository-converter

When invoked without parameters the usage and help information is printed.
The `newts-repository-converter` tool provides the following options and parameters:

<table>
<thead>
<tr>
<th>Short-option</th>
<th>Long-option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>h</td>
<td>help</td>
<td>Prints help and usage information</td>
<td>false</td>
</tr>
<tr>
<td>o</td>
<td>onms-home</td>
<td>OpenNMS Horizon Home Directory</td>
<td>/opt/opennms</td>
</tr>
<tr>
<td>r</td>
<td>rrd-dir</td>
<td>The path to the RRD data</td>
<td>ONMS-HOME/share/rrd</td>
</tr>
<tr>
<td>t</td>
<td>rrd-tool</td>
<td>Whether to use rrdtool or JRobin</td>
<td></td>
</tr>
<tr>
<td>T</td>
<td>rrd-binary</td>
<td>The binary path to the rrdtool command (only used if rrd-tool is set)</td>
<td>/usr/bin/rrdtool</td>
</tr>
<tr>
<td>s</td>
<td>store-by-group</td>
<td>Whether store by group was enabled or not</td>
<td></td>
</tr>
<tr>
<td>n</td>
<td>threads</td>
<td>Number of conversion threads</td>
<td>defaults to number of CPUs</td>
</tr>
</tbody>
</table>

### 18.4.3. Example 1: convert Rrd-based data with storeByGroup enabled

The following example shows how to convert RRDTool-based data that was stored with storeByGroup enabled. The OpenNMS Horizon home is `/opt/opennms`, the data directory is `/opt/opennms/share/rrd` and the RRDTool binary located at `/usr/local/bin/rrdtool`. This program call will use 16 concurrent threads to convert the Rrd files.

```
$ ./newts-repository-converter -t true -s true -T /usr/local/bin/rrdtool -n 16
```

### 18.4.4. Example 2: convert JRobin-based data with storeByGroup disabled

The following example shows how to convert JRobin-based data located in the directory `/mnt/opennms/rrd` that was collected with storeByGroup disabled. This program call will use 8 concurrent threads to convert the Jrb files.

```
$ ./newts-repository-converter -t false -s false -r /mnt/opennms/rrd -n 8
```

### 18.5. Configuration Tester

To identify configuration problems there is a config-tester located in `$OPENNMS_HOME/bin/`. Use `config-tester` to check configuration files. Type `-l, --list` to view the list of files checked. It prints issues into `output.log`. The tool can be used while OpenNMS is running to check configuration beforehand.
18.6. Newts

This section describes how to configure OpenNMS Horizon to use Newts and how to use OpenNMS Horizon to monitor your Cassandra cluster.

18.6.1. Configuration

Enabling Newts

OpenNMS Horizon can be configured to use Newts by setting the following property in in

{OPENNMS_HOME}/etc/opennms.properties:

```
org.opennms.timeseries.strategy=newts
```

It is also highly recommended that resources stored in Newts are referenced by their foreign source and foreign ID, as opposed to their database ID. To this end, the following property should also be set in the same file:

```
org.opennms.rrd.storeByForeignSource=true
```

With these set, OpenNMS Horizon will begin persisting metrics using the Newts engine when restarted.

Additional configuration options are presented in the next section.

Configuration Reference

The following properties, found in {OPENNMS_HOME}/etc/opennms.properties, can be used to configure and tune Newts.
<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>org.opennms.newts.config.keyspace</td>
<td>newts</td>
<td>Name of the keyspace to use.</td>
</tr>
<tr>
<td>org.opennms.newts.config.hostname</td>
<td>localhost</td>
<td>IP address or hostnames of the Cassandra nodes. Multiple hosts can be separated by a comma.</td>
</tr>
<tr>
<td>org.opennms.newts.config.port</td>
<td>9042</td>
<td>CQL port used to connect to the Cassandra nodes.</td>
</tr>
<tr>
<td>org.opennms.newts.config.user</td>
<td>cassandra</td>
<td>Username to use when connecting to Cassandra via CQL.</td>
</tr>
<tr>
<td>org.opennms.newts.config.password</td>
<td>cassandra</td>
<td>Password to use when connecting to Cassandra via CQL.</td>
</tr>
<tr>
<td>org.opennms.newts.config.ssl</td>
<td>false</td>
<td>Enable/disable SSL when connecting to Cassandra.</td>
</tr>
<tr>
<td>org.opennms.newts.config.core-connections-per-host</td>
<td>Driver default</td>
<td>Core number of connections per host.</td>
</tr>
<tr>
<td>org.opennms.newts.config.max-connections-per-host</td>
<td>Driver default</td>
<td>Maximum number of connections per host.</td>
</tr>
<tr>
<td>org.opennms.newts.config.max-requests-per-connection</td>
<td>Driver default</td>
<td>Maximum amount of requests that can be in-flight on a single connection at the same time.</td>
</tr>
<tr>
<td>org.opennms.newts.config.read_consistency</td>
<td>ONE</td>
<td>Consistency level used for read operations. See Configuring data consistency for a list of available options.</td>
</tr>
<tr>
<td>org.opennms.newts.config.write_consistency</td>
<td>ANY</td>
<td>Consistency level used for write operations. See Configuring data consistency for a list of available options.</td>
</tr>
<tr>
<td>org.opennms.newts.config.max_batch_size</td>
<td>16</td>
<td>Maximum number of records to insert in a single transaction. Limited by the size of the Cassandra cluster’s batch_size_fail_threshold_in_kb property.</td>
</tr>
<tr>
<td>org.opennms.newts.config.ring_buffer_size</td>
<td>8192</td>
<td>Maximum number of records that can be held in the ring buffer. Must be a power of two.</td>
</tr>
<tr>
<td>org.opennms.newts.config.writer_threads</td>
<td>16</td>
<td>Number of threads used to pull samples from the ring buffer and insert them into Newts.</td>
</tr>
<tr>
<td>org.opennms.newts.config.ttl</td>
<td>31540000</td>
<td>Number of seconds after which samples will automatically be deleted. Defaults to one year.</td>
</tr>
<tr>
<td>org.opennms.newts.config.resource_shard</td>
<td>604800</td>
<td>Duration in seconds for which samples will be stored at the same key. Defaults to 7 days in seconds.</td>
</tr>
<tr>
<td>org.opennms.newts.query.minimum_step</td>
<td>300000</td>
<td>Minimum step size in milliseconds. Used to prevent large queries.</td>
</tr>
<tr>
<td>Name</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>org.opennms.newts.query.interval_divider</td>
<td>2</td>
<td>If no interval is specified in the query, the step will be divided into this many intervals when aggregating values.</td>
</tr>
<tr>
<td>org.opennms.newts.query.heartbeat</td>
<td>450000</td>
<td>Duration in milliseconds. Used when no heartbeat is specified. Should generally be 1.5x your largest collection interval.</td>
</tr>
<tr>
<td>org.opennms.newts.query.parallelism</td>
<td></td>
<td>Maximum number of threads that can be used to compute aggregates. Defaults to the number of available cores.</td>
</tr>
<tr>
<td>org.opennms.newts.config.cache.strategy</td>
<td>See bellow</td>
<td>Canonical name of the class used for resource level caching. See the table below for all of the available options.</td>
</tr>
<tr>
<td>org.opennms.newts.config.cache.max_entries</td>
<td>8192</td>
<td>Maximum number of records to keep in the cache when using an in-memory caching strategy.</td>
</tr>
<tr>
<td>org.opennms.newts.nan_on_counter_wrap</td>
<td>false</td>
<td>Disables the processing of counter wraps, replacing these with NaNs instead.</td>
</tr>
<tr>
<td>org.opennms.newts.config.cache.priming.disable</td>
<td>false</td>
<td>Disables the cache primer, which pre-emptively loads the cache with indexed resources on start-up.</td>
</tr>
<tr>
<td>org.opennms.newts.config.cache.priming.block_ms</td>
<td>120000</td>
<td>Block startup for this many milliseconds while waiting for the cache to be primed. Set this value to -1 to disable blocking. Set this value to 0 to block indefinitely waiting for all of the records to be read.</td>
</tr>
</tbody>
</table>

Available caching strategies include:

<table>
<thead>
<tr>
<th>Name</th>
<th>Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-Memory Cache</td>
<td>org.opennms.netmgmt.newts.support.GuavaSearchableResourceMetadataCache</td>
</tr>
<tr>
<td>Redis-based Cache</td>
<td>org.opennms.netmgmt.newts.support.RedisResourceMetadataCache</td>
</tr>
</tbody>
</table>

Redis Cache

When enabled, the following options can be used to configure the Redis-based cache.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>org.opennms.newts.config.cache.redis_hostname</td>
<td>localhost</td>
<td>IP address of hostname of the Redis server.</td>
</tr>
<tr>
<td>Name</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------------------</td>
<td>---------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>org.opennms.newts.config.cache.redis_port</td>
<td>6379</td>
<td>TCP port used to connect to the Redis server.</td>
</tr>
</tbody>
</table>

**Recommendations**

You will likely want to change the values of `cache.max_entries` and the `ring_buffer_size` to suit your installation.

Meta-data related to resources are cached in order to avoid writing redundant records in Cassandra. If you are collecting data from a large number of resources, you should increase the `cache.max_entries` to reflect the number of resources you are collecting from, with a suitable buffer.

The samples gathered by the collectors are temporarily stored in a ring buffer before they are persisted to Cassandra using Newts. The value of the `ring_buffer_size` should be increased if you expect large peaks of collectors returning at once or latency in persisting these to Cassandra. However, note that the memory used by the ring buffer is reserved, and larger values may require an increased heap size.

Cache priming is used to help reduce the number of records that need to be indexed after restarting OpenNMS Horizon. This works by rebuilding the cache using the index data that has already been persisted in Cassandra. If you continue to see large spikes of index related inserts after rebooting you may want to consider increasing the amount of time spent priming the cache.

**18.6.2. Cassandra Monitoring**

This section describes some of the metrics OpenNMS Horizon collects from a Cassandra cluster.

- JMX must be enabled on the Cassandra nodes and made accessible from OpenNMS Horizon in order to collect these metrics. See Enabling JMX authentication for details.

- The data collection is bound to the agent IP interface with the service name JMX-Cassandra. The JMXCollector is used to retrieve the MBean entities from the Cassandra node.

**Client Connections**

The number of active client connections from org.apache.cassandra.metrics.Client are collected:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>connectedNativeClients</td>
<td>Metrics for connected native clients</td>
</tr>
<tr>
<td>connectedThriftClients</td>
<td>Metrics for connected thrift clients</td>
</tr>
</tbody>
</table>
Compaction Bytes

The following compaction manager metrics from `org.apache.cassandra.metrics.Compaction` are collected:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BytesCompacted</td>
<td>Number of bytes compacted since node started</td>
</tr>
</tbody>
</table>

Compaction Tasks

The following compaction manager metrics from `org.apache.cassandra.metrics.Compaction` are collected:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CompletedTasks</td>
<td>Estimated number of completed compaction tasks</td>
</tr>
<tr>
<td>PendingTasks</td>
<td>Estimated number of pending compaction tasks</td>
</tr>
</tbody>
</table>

Storage Load

The following storage load metrics from `org.apache.cassandra.metrics.Storage` are collected:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Load</td>
<td>Total disk space (in bytes) used by this node</td>
</tr>
</tbody>
</table>

Storage Exceptions

The following storage exception metrics from `org.apache.cassandra.metrics.Storage` are collected:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exceptions</td>
<td>Number of unhandled exceptions since start of this Cassandra instance</td>
</tr>
</tbody>
</table>

Dropped Messages

Measurement of messages that were *DROPPABLE*. These ran after a given timeout set per message type so was thrown away. In *JMX* these are accessible via `org.apache.cassandra.metrics.DroppedMessage`. The number of dropped messages in the different message queues are good indicators whether a cluster can handle its load.

<table>
<thead>
<tr>
<th>Name</th>
<th>Stage</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mutation</td>
<td>MutationStage</td>
<td>If a write message is processed after its timeout (write_request_timeout_in_ms) it either sent a failure to the client or it met its requested consistency level and will relay on hinted handoff and read repairs to do the mutation if it succeeded.</td>
</tr>
<tr>
<td>Name</td>
<td>Stage</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Counter_Mutation</td>
<td>MutationStage</td>
<td>If a write message is processed after its timeout (write_request_timeout_in_ms) it either sent a failure to the client or it met its requested consistency level and will relay on hinted handoff and read repairs to do the mutation if it succeeded.</td>
</tr>
<tr>
<td>Read_Repair</td>
<td>MutationStage</td>
<td>Times out after write_request_timeout_in_ms.</td>
</tr>
<tr>
<td>Read</td>
<td>ReadStage</td>
<td>Times out after read_request_timeout_in_ms. No point in servicing reads after that point since it would of returned error to client.</td>
</tr>
<tr>
<td>Range_Slice</td>
<td>ReadStage</td>
<td>Times out after range_request_timeout_in_ms.</td>
</tr>
<tr>
<td>Request_Response</td>
<td>RequestResponseStage</td>
<td>Times out after request_timeout_in_ms. Response was completed and sent back but not before the timeout</td>
</tr>
</tbody>
</table>

**Thread pools**

*Apache Cassandra* is based on a so called *Staged Event Driven Architecture* (SEDA). This separates different operations in stages and these stages are loosely coupled using a messaging service. Each of these components use queues and thread pools to group and execute their tasks. The documentation for *Cassandra* Thread pool monitoring is originated from *Pythian Guide to Cassandra Thread Pools*.

**Table 126. Collected metrics for Thread Pools**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActiveTasks</td>
<td>Tasks that are currently running</td>
</tr>
<tr>
<td>CompletedTasks</td>
<td>Tasks that have been completed</td>
</tr>
<tr>
<td>CurrentlyBlockedTasks</td>
<td>Tasks that have been blocked due to a full queue</td>
</tr>
<tr>
<td>PendingTasks</td>
<td>Tasks queued for execution</td>
</tr>
</tbody>
</table>

**Memtable FlushWriter**

Sort and write *memtables* to disk from *org.apache.cassandra.metrics.ThreadPools*. A vast majority of time this backing up is from over running disk capability. The sorting can cause issues as well however. In the case of sorting being a problem, it is usually accompanied with high load but a small amount of actual flushes (seen in cfstats). Can be from huge rows with large column names, i.e. something inserting many large values into a *CQL* collection. If overrunning disk capabilities, it is recommended to add nodes or tune the configuration.

Alerts: pending > 15 || blocked > 0

**Memtable Post Flusher**

Operations after flushing the *memtable*. Discard commit log files that have had all data in them in *sstable*. Flushing non-cf backed secondary indexes.
Anti Entropy Stage

Repairing consistency. Handle repair messages like merkle tree transfer (from Validation compaction) and streaming.

Gossip Stage

Post 2.0.3 there should no longer be issue with pending tasks. Instead monitor logs for a message:

Gossip stage has {} pending tasks; skipping status check ...

Before that change, in particular older versions of 1.2, with a lot of nodes (100+) while using vnodes can cause a lot of CPU intensive work that caused the stage to get behind. Been known to of been caused with out of sync schemas. Check NTP working correctly and attempt nodetool resetlocalschema or the more drastic deleting of system column family folder.

Migration Stage

Making schema changes

MiscStage

Snapshotting, replicating data after node remove completed.

Mutation Stage

Performing a local including:

- insert/updates
- Schema merges
- commit log replays
- hints in progress

Similar to ReadStage, an increase in pending tasks here can be caused by disk issues, over loading a system, or poor tuning. If messages are backed up in this stage, you can add nodes, tune hardware and configuration, or update the data model and use case.
Read Stage

Performing a local read. Also includes deserializing data from row cache. If there are pending values this can cause increased read latency. This can spike due to disk problems, poor tuning, or overloading your cluster. In many cases (not disk failure) this is resolved by adding nodes or tuning the system.

Request Response Stage

When a response to a request is received this is the stage used to execute any callbacks that were created with the original request.

Read Repair Stage

Performing read repairs. Chance of them occurring is configurable per column family with `read_repair_chance`. More likely to back up if using `CL.ONE` (and to lesser possibly other `non-CL.ALL` queries) for reads and using multiple data centers. It will then be kicked off asynchronously outside of the queries feedback loop. Note that this is not very likely to be a problem since does not happen on all queries and is fast providing good connectivity between replicas. The repair being droppable also means that after `write_request_timeout_in_ms` it will be thrown away which further mitigates this. If pending grows attempt to lower the rate for high read CFs.

JVM Metrics

Some key metrics from the running Java virtual machine are also collected:

`java.lang:type=Memory`

The memory system of the Java virtual machine. This includes heap and non-heap memory

`java.lang:type=GarbageCollector,name=ConcurrentMarkSweep`

Metrics for the garbage collection process of the Java virtual machine

If you use Apache Cassandra for running Newts you can also enable additional metrics for the Newts keyspace.

18.6.3. Newts Monitoring

This section describes the metrics OpenNMS Horizon collects for monitoring the Newts keyspace from `org.apache.cassandra.metrics.Keyspace` on a Cassandra node.
JMX must be enabled on the Cassandra nodes and made accessible from _OpenNMS Horizon_ in order to collect these metrics. See [Enabling JMX authentication](#) for details.

The data collection is bound to the agent IP interface with the service name _JMX-Cassandra-Newts_. The _JMXCollector_ is used to retrieve the _MBean_ entities from the _Cassandra_ node.

### All Memory Table Data Size

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AllMemtablesLiveDataSize</td>
<td>Total amount of live data stored in the memtables (2i and pending flush memtables included) that resides off-heap, excluding any data structure overhead</td>
</tr>
<tr>
<td>AllMemtablesOffHeapDataSize</td>
<td>Total amount of data stored in the memtables (2i and pending flush memtables included) that resides off-heap.</td>
</tr>
<tr>
<td>AllMemtablesOnHeapDataSize</td>
<td>Total amount of data stored in the memtables (2i and pending flush memtables included) that resides on-heap.</td>
</tr>
</tbody>
</table>

### Memtable Switch Count

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MemtableSwitchCount</td>
<td>Number of times flush has resulted in the memtable being switched out.</td>
</tr>
</tbody>
</table>

### Memtable Columns Count

<table>

<tr>
<td>LiveDiskSpaceUsed</td>
<td>Disk space used by SSTables belonging to this column family</td>
</tr>
</tbody>
</table>

18.7. Timeseries Integration Layer

This section describes how to configure OpenNMS Horizon to use the Time Series Integration Layer.

Traditionally OpenNMS Horizon supports storing time series data in RRD files on disk or via Newts in Cassandra. These implementations require a deep knowledge of OpenNMS. It is hard to add another time series database.

With the rise of many new time series databases, we want to provide an easy way to support other time series databases with minimal effort. This lead to the development of the Time Series Integration Layer.

The Time Series Integration Layer allows users to integrate a new time series database via OSGi plugin.

Examples of time series plugins:

- In Memory
- InfluxDB
- TimescaleDB

18.7.1. Configuration

Enabling Time Series Integration Layer

OpenNMS Horizon can be configured to use the Time Series Integration Layer by setting the following property in ${OPENNMS_HOME}/etc/opennms.properties:

```
org.opennms.timeseries.strategy=integration
```

After activating the Time Series Integration Layer, you need to start an actual implementation. Do this via Karaf. Here is an example of how to activate the in memory time series plugin:
clone & build:
  git clone git@github.com:opennms-forge/timeseries-integration-inmemory.git
  mvn install

in Karaf shell:
  bundle:install -s mvn:org.opennms.plugins.timeseries.inmemory/timeseries-inmemory-plugin/1.0.0-SNAPSHOT

For specific instructions, check your plugin description.

We also highly recommend that you reference resources stored in the *Time Series Integration Layer* by their foreign source and foreign ID, as opposed to their database ID. To this end, set the following property in the same file:

```org.opennms.rrd.storeByForeignSource=true```

With these set, *OpenNMS Horizon* will begin persisting metrics using the *Time Series Integration Layer* when restarted.

Additional configuration options are presented in the next section.

**Configuration Reference**

The following properties, found in `$OPENNMS_HOME/etc/opennms.properties`, can be used to configure and tune the *Time Series Integration Layer*.

**General**

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>org.opennms.timeseries.config.ring_buffer_size</td>
<td>8192</td>
<td>Maximum number of records that can be held in the ring buffer. Must be a power of two.</td>
</tr>
<tr>
<td>org.opennms.timeseries.config.writer_threads</td>
<td>16</td>
<td>Number of threads used to pull samples from the ring buffer and insert them into the Time Series Database.</td>
</tr>
<tr>
<td>org.opennms.timeseries.query.minimum_step</td>
<td>300000</td>
<td>Minimum step size in milliseconds. Used to prevent large queries.</td>
</tr>
<tr>
<td>org.opennms.timeseries.query.interval_divider</td>
<td>2</td>
<td>If no interval is specified in the query, the step will be divided into this many intervals when aggregating values.</td>
</tr>
<tr>
<td>org.opennms.timeseries.query.heartbeat</td>
<td>450000</td>
<td>Duration in milliseconds. Used when no heartbeat is specified. Should generally be 1.5x your largest collection interval.</td>
</tr>
<tr>
<td>Name</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------------------</td>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>org.opennms.timeseries.query.parallelism</code></td>
<td>Number of cores</td>
<td>Maximum number of threads that can be used to compute aggregates. Defaults to the number of available cores.</td>
</tr>
<tr>
<td><code>cache.timeseriesPersisterMetaTagCache.expireAfterRead</code></td>
<td>300</td>
<td>Expiry time in seconds for MetaTagCache.</td>
</tr>
<tr>
<td><code>cache.timeseriesPersisterMetaTagCache.maximumSize</code></td>
<td>8192</td>
<td>Maximum size for MetaTagCache.</td>
</tr>
<tr>
<td><code>cache.timeseriesPersisterMetaTagCache.recordStats</code></td>
<td>true</td>
<td>Should cache statistics be exposed via JMX for MetaTagCache?</td>
</tr>
<tr>
<td><code>cache.timeseriesSearcherCache.expireAfterRead</code></td>
<td>300</td>
<td>Expiry time in seconds for TimeseriesSearcherCache.</td>
</tr>
<tr>
<td><code>cache.timeseriesSearcherCache.maximumSize</code></td>
<td>8192</td>
<td>Maximum size for TimeseriesSearcherCache.</td>
</tr>
<tr>
<td><code>cache.timeseriesSearcherCache.recordStats</code></td>
<td>true</td>
<td>Should cache statistics be exposed via JMX for TimeseriesSearcherCache?</td>
</tr>
<tr>
<td><code>cache.timeseriesMetaDataCache.expireAfterRead</code></td>
<td>300</td>
<td>Expiry time in seconds for TimeseriesMetaDataCache.</td>
</tr>
<tr>
<td><code>cache.timeseriesMetaDataCache.maximumSize</code></td>
<td>8192</td>
<td>Maximum size for TimeseriesMetaDataCache.</td>
</tr>
<tr>
<td><code>cache.timeseriesMetaDataCache.recordStats</code></td>
<td>true</td>
<td>Should cache statistics be exposed via JMX for TimeseriesMetaDataCache?</td>
</tr>
</tbody>
</table>

**Recommendations**

Caches have been introduced to improve performance. You might need to tune the cache settings to suit your needs. See parameters above.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TimeseriesMetaDataCache</td>
<td>Caches metadata that uses OpenNMS Horizon internally.</td>
</tr>
<tr>
<td>TimeseriesSearcherCache</td>
<td>Caches metrics by tag to improve the resource lookup.</td>
</tr>
<tr>
<td>TimeseriesPersisterMetaTagCache</td>
<td>Caches all additionally configured and resolved meta-tag values by resource.</td>
</tr>
</tbody>
</table>

The samples gathered by the collectors are temporarily stored in a ring buffer before they are persisted to the Time Series Integration Layer. The value of the `ring_buffer_size` should be increased if you expect large peaks of collectors returning at once or latency in persisting these. However, note that the memory used by the ring buffer is reserved, and larger values may require an increased heap size.
Expose additional meta tags

Metrics that are stored via the time series plugin contain the minimal set of tags for *OpenNMS Horizon* to work. This might not be sufficient if the data is used outside of *OpenNMS Horizon* as well. Configure additional meta tags via `${OPENNMS_HOME}/etc/opennms.properties`.

The configuration of the tags has the following form: `prefix.tagKey=${query expression}`

- The prefix is: `org.opennms.timeseries.tin.metatags.tag`
- The `tagKey` can by an arbitrary string as long as it doesn't break the java property file syntax.
- The query expression allows to query the value. Hereby we can make use of the Meta-Data-DSL

Examples:

- `org.opennms.timeseries.tin.metatags.tag.nodelabel=${node:label}`
- `org.opennms.timeseries.tin.metatags.tag.sysObjectID=${node:sys-object-id}`

Expose categories by setting `org.opennms.timeseries.tin.metatags.exposeCategories` to true.

Example: `org.opennms.timeseries.tin.metatags.exposeCategories=true` will lead to: `Tag("cat_myFirstCategory", "myFirstCategory") Tag("cat_mySecondCategory", "mySecondCategory")`

### 18.8. Daemon Configuration Files

Configuration changes require a restart of OpenNMS and some daemons are able to reload configuration changes triggered by a daemon reload event. This section gives an overview about all daemons and the related configuration files and which can be reloaded without restarting OpenNMS.

#### 18.8.1. Eventd

<table>
<thead>
<tr>
<th>Internal Daemon Name</th>
<th>Reload Event</th>
</tr>
</thead>
<tbody>
<tr>
<td>Eventd</td>
<td>uei.opennms.org/internal/reloadDaemonConfig -p 'daemonName Eventd'</td>
</tr>
</tbody>
</table>

Table 127. Eventd configuration file overview

<table>
<thead>
<tr>
<th>File</th>
<th>Restart Required</th>
<th>Reload Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>eventd-configuration.xml</td>
<td>yes</td>
<td>no</td>
<td>Configure generic behavior of Eventd, i.e. TCP and UDP port numbers with IP addresses to listen for Events and socket timeouts.</td>
</tr>
<tr>
<td>eventconf.xml</td>
<td>no</td>
<td>yes</td>
<td>Main configuration file for Eventd.</td>
</tr>
<tr>
<td>events/*</td>
<td>no</td>
<td>yes</td>
<td>Out-of-the-box, all files in this folder are included via include directives in eventconf.xml.</td>
</tr>
</tbody>
</table>
18.8.2. Notifd

<table>
<thead>
<tr>
<th>Internal Daemon Name</th>
<th>Reload Event</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notifd</td>
<td>uei.opennms.org/internal/reloadDaemonConfig -p 'daemonName Notifd'</td>
</tr>
</tbody>
</table>

Table 128. Notifd configuration file overview

<table>
<thead>
<tr>
<th>File</th>
<th>Restart Required</th>
<th>Reload Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifd-configuration.xml</td>
<td>no</td>
<td>yes</td>
<td>Describes auto-acknowledge prefix, e.g. prefix &quot;RESOLVED: &quot; for nodeUp/nodeDown events.</td>
</tr>
<tr>
<td>notificationCommands.xml</td>
<td>no</td>
<td>no</td>
<td>Configuration for notification media, e.g. scripts, XMPP or HTTP Post, immediately applied.</td>
</tr>
<tr>
<td>notifications.xml</td>
<td>no</td>
<td>no</td>
<td>Event notification definitions and changes are immediately applied.</td>
</tr>
<tr>
<td>destinationPaths.xml</td>
<td>no</td>
<td>no</td>
<td>Contains paths for notification targets, e.g. JavaMail, XMPP or external scripts.</td>
</tr>
<tr>
<td>users.xml</td>
<td>no</td>
<td>no</td>
<td>Contain pager and address information for notification destination paths.</td>
</tr>
<tr>
<td>groups.xml</td>
<td>no</td>
<td>no</td>
<td>Groups can be used as target for notifications.</td>
</tr>
<tr>
<td>javamail-configuration.properties</td>
<td>no</td>
<td>no</td>
<td>Configuration to send notification mails via specific mail servers.</td>
</tr>
</tbody>
</table>

18.8.3. Pollerd

<table>
<thead>
<tr>
<th>Internal Daemon Name</th>
<th>Reload Event</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pollerd</td>
<td>uei.opennms.org/internal/reloadDaemonConfig -p 'daemonName Pollerd'</td>
</tr>
</tbody>
</table>

Table 129. Pollerd configuration file overview

<table>
<thead>
<tr>
<th>File</th>
<th>Restart Required</th>
<th>Reload Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>poller-configuration.xml</td>
<td>yes</td>
<td>yes</td>
<td>Restart is required in case new monitors are created or removed. Reload Event loads changed configuration parameters of existing monitors.</td>
</tr>
<tr>
<td>response-graph.properties</td>
<td>no</td>
<td>no</td>
<td>Graph definition for response time graphs from monitors</td>
</tr>
</tbody>
</table>
### Internal Daemon Name | Reload Event
--- | ---
**Syslogd** | uei.opennms.org/internal/reloadDaemonConfig -p 'daemonName Syslogd'

Syslogd reload event stops and starts daemon and loads all the syslogd configuration changes.

Syslog daemon can be reloaded with following shell command on karaf.

```
$ ssh -p 8101 admin@localhost
...
admin@opennms> opennms:reload-daemon syslogd
```

### Internal Daemon Name | Reload Event
--- | ---
**Trapd** | uei.opennms.org/internal/reloadDaemonConfig -p 'daemonName Trapd'

Trapd reload event stops and starts daemon and loads all the trapd configuration changes.

Trapd daemon can also be reloaded with following shell command on karaf.

```
$ ssh -p 8101 admin@localhost
...
admin@opennms> opennms:reload-daemon trapd
```
Chapter 19. System Properties

The global behavior of OpenNMS Horizon is configured with properties files. Configuration can also affect the Java Virtual Machine under which OpenNMS Horizon runs. Changes in these properties files require a restart of OpenNMS Horizon. The configuration files can be found in `${OPENNMS_HOME}/etc`.

The priority for Java system properties is as follows:

1. Those set via the Java command line i.e. in `opennms.conf` via `ADDITIONAL_MANAGER_OPTIONS`
2. `opennms.properties.d/*.properties`
3. `opennms.properties`
4. `libraries.properties`
5. `rrd-configuration.properties`
6. `bootstrap.properties`

Property files in `opennms.properties.d/` are sorted alphabetically.

To avoid conflicts with customized configurations, all custom properties can be added to one or more files in `${OPENNMS_HOME}/etc/opennms.properties.d/`. It is recommended to avoid modification of OpenNMS properties from the default installation. Create dedicated files with your customized properties in `opennms.properties.d/`.

19.1. Configuring system proxies

System proxy settings may be used with certain OpenNMS Horizon components via the `use-system-proxy` or `useSystemProxy` parameters. To configure system proxy servers, set some or all of the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>http.proxyHost</code></td>
<td>None</td>
<td>Hostname or IP address of proxy server to use for plain HTTP requests</td>
</tr>
<tr>
<td><code>http.proxyPort</code></td>
<td>3128</td>
<td>TCP port of proxy server to use for plain HTTP requests</td>
</tr>
<tr>
<td><code>https.proxyHost</code></td>
<td>None</td>
<td>Hostname or IP address of proxy server to use for HTTPS requests</td>
</tr>
<tr>
<td><code>https.proxyPort</code></td>
<td>3128</td>
<td>TCP port of proxy server to use for HTTPS requests</td>
</tr>
<tr>
<td><code>http.nonProxyHosts</code></td>
<td>None</td>
<td>Pipe-separated list of hostnames or IP addresses which bypass HTTP proxying</td>
</tr>
<tr>
<td><code>https.nonProxyHosts</code></td>
<td>None</td>
<td>Pipe-separated list of hostnames or IP addresses which bypass HTTPS proxying</td>
</tr>
<tr>
<td>![Lightbulb Icon]</td>
<td>Depending on the JVM in use, the properties <code>http.proxyUser</code>, <code>http.proxyPassword</code>, and their <code>https.*</code> equivalents may enable the use of proxy servers that require authentication.</td>
<td></td>
</tr>
<tr>
<td>![Warning Icon]</td>
<td>Setting these properties may have unintended effects. Use with care.</td>
<td></td>
</tr>
</tbody>
</table>
Chapter 20. Ticketing

The ticketing integration allows OpenNMS Horizon to create trouble tickets in external systems. Tickets can be created and updated in response to new and/or resolved alarms.

To activate the ticketing integration, the following properties in `${OPENNMS_HOME}/etc/opennms.properties` must be set accordingly:

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opennms.ticketer.plugin</td>
<td>NullTickete rPlugin</td>
<td>The plugin implementation to use. Each ticketer integration should define which value to set. The NullTicketerPlugin does nothing when attempting to create/update/delete tickets.</td>
</tr>
<tr>
<td>opennms.alarmTroubleTicketEnab led</td>
<td>false</td>
<td>Defines if the integration is enabled. If enabled various links to control the issue state is shown on the alarm details page.</td>
</tr>
<tr>
<td>opennms.alarmTroubleTicketLinkTemplate</td>
<td>${id}</td>
<td>A template to generate a link to the issue, e.g. <a href="http://issues.opennms.org/browse/$%7Bid%7D">http://issues.opennms.org/browse/${id}</a></td>
</tr>
</tbody>
</table>

20.1. JIRA Ticketing Plugin

The JIRA Ticketing Plugin is used to create JIRA Issues in response to OpenNMS Horizon alarms.

20.1.1. Setup

First, you'll need to install the `opennms-plugin-ticketer-jira` package for your system. The JIRA ticketing plugin and its dependencies are not part of the core packages.

Now, in order to enable the plugin start by setting following property in `${OPENNMS_HOME}/etc/opennms.properties`:

```
opennms.ticketer.plugin=org.opennms.netmgt.ticketd.OSGiBasedTicketerPlugin
```

Configure the plugin options by setting the following properties in `${OPENNMS_HOME}/etc/jira.properties`:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>jira.host</td>
<td>JIRA Server Url</td>
</tr>
<tr>
<td>jira.username</td>
<td>Username</td>
</tr>
<tr>
<td>jira.password</td>
<td>Password</td>
</tr>
<tr>
<td>jira.project</td>
<td>The key of the project to use. Use jira:list-projects command to determine the project key.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>jira.type</td>
<td>The Issue Type Id to use when opening new issues. Use <code>jira:list-issue-types</code> command to determine the issue type id.</td>
</tr>
<tr>
<td>jira.resolve</td>
<td>Name of the transition to use when resolving issues</td>
</tr>
<tr>
<td>jira.reopen</td>
<td>Name of the transition to use when re-opening issues</td>
</tr>
<tr>
<td>jira.status.open</td>
<td>Comma-separated list of JIRA status names for which the ticket should be considered ‘Open’</td>
</tr>
<tr>
<td>jira.status.close</td>
<td>Comma-separated list of JIRA status names for which the ticket should be considered ‘Closed’</td>
</tr>
<tr>
<td>jira.status.cancelled</td>
<td>Comma-separated list of JIRA status names for which the ticket should be considered ‘Cancelled’</td>
</tr>
<tr>
<td>jira.cache.reload</td>
<td>The time in milliseconds it takes to reload the fields cache. This is required to prevent the plugin to read the issue type's meta data every time an issue is created. A value of 0 disables the cache. Default value is 300000 (5 minutes).</td>
</tr>
</tbody>
</table>

The transition names for `resolve` and `reopen` are typically found on buttons when looking at the ticket in JIRA.

Either use `opennms:jist-list-issue-types` **OSGI Command** or [https://confluence.atlassian.com/display/JIRA050/Finding+the+Id+for+Issue+Types](https://confluence.atlassian.com/display/JIRA050/Finding+the+Id+for+Issue+Types) for determining the appropriate issue type id.

Next, add `jira-troubleticketer` to the `featuresBoot` property in the `${OPENNMS_HOME}/etc/org.apache.karaf.features.cfg`

Restart OpenNMS Horizon.

When OpenNMS Horizon has started again, login to the Karaf Shell and install the feature:

```
feature:install jira-troubleticketer
```

The plugin should be ready to use.

### 20.1.2. Jira Commands

The JIRA Ticketing Plugin provides various **OSGI Commands** which can be used on the Karaf Shell to help set up the plugin.

There are OSGI Commands to list all available projects, versions, components, groups, issue types and even more.

To list all available commands simply type `help | grep jira` in the Karaf Shell.
Afterwards you can type for example `opennms:jira-list-projects --help` to determine the usage of a command.

### 20.1.3. Custom fields

The *OpenNMS Horizon* Ticketer model is limited to the most common fields provided by all ticketing systems.

Besides the common fields creator, create date, description or subject, ticket system proprietary fields usually need to be set.

In some cases, even additional - so called - custom fields are defined.

In order to set these fields, the *JIRA Ticketing Plugin* provides the possibility to define those in the OpenNMS Ticket attributes which can be overwritten with the Usage of Drools.

To enable the Drools Ticketing integration, the following property in `${OPENNMS_HOME}/etc/opennms.properties` must be set:

```properties
opennms.ticketer.servicelayer=org.opennms.netmgt.ticketd.DroolsTicketerServiceLayer
```

In addition the property in `${OPENNMS_HOME/etc/drools-ticketer.properties` must point to a `drools-ticketer-rules.drl` file:

```properties
drools-ticketer.rules-file=${OPENNMS_HOME/etc/drools-ticketer-rules.drl
```

Finally a Drools Rule file named `drools-ticketer-rules.drl` must be placed in `${OPENNMS_HOME}/etc`.

The following drools example snippet defines attributes to set custom fields:

```drools
// Set ticket defaults
rule "TicketDefaults"
salience 100
when
  $alarm : OnmsAlarm()
then
  ticket.setSummary($alarm.logMsg);
  ticket.setDetails($alarm.description);
  ticket.addAttribute("customfield_10111", "custom-value");
  ticket.addAttribute("customfield_10112", "my-location");
  ticket.addAttribute("customfield_10113", "some classification");
end
```

Fields must be referenced by their *id*. To identify the *id* of a field, the `opennms:jira-list-fields` command can be used. By default only custom fields are shown. The `-s` options allows to show all fields. This may be necessary if JIRA default values need to be set as well, e.g. the Component, the Reporter, the Asignee, etc. Even the project key or issue type can be defined differently than
originally in the `jira.properties`.

The OpenNMS Ticketer Attribute model only allows to set a String value. However the JIRA model is slightly different. Therefore each String value must be converted to a JIRA field type. The following table describes valid values for an OpenNMS attribute.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>any</td>
<td>Any string.</td>
</tr>
<tr>
<td>date</td>
<td>Any date in the format of <code>YYYY-MM-DD</code>.</td>
</tr>
<tr>
<td>datetime</td>
<td>Any datetime in ISO 8601 format: <code>YYYY-MM-DDThh:mm:ss.sTZD</code>.</td>
</tr>
<tr>
<td>group</td>
<td>The name of the group.</td>
</tr>
<tr>
<td>user</td>
<td>The name of the user.</td>
</tr>
<tr>
<td>project</td>
<td>The key of the project (e.g. NMS).</td>
</tr>
<tr>
<td>version</td>
<td>The name of the version. To list all available versions, use <code>jira:list-versions</code>.</td>
</tr>
<tr>
<td>string</td>
<td>Any string.</td>
</tr>
<tr>
<td>option</td>
<td>The name of the option.</td>
</tr>
<tr>
<td>issuuetype</td>
<td>The name of the issuetype, e.g. Bug. To list all issue types, use <code>jira:list-issue-types</code>.</td>
</tr>
<tr>
<td>priority</td>
<td>The name of the priority, e.g. Major. To list all priorities, use <code>jira:list-priorities</code>.</td>
</tr>
<tr>
<td>option-with-child</td>
<td>Either the name of the option, or a comma separated list (e.g. parent,child).</td>
</tr>
<tr>
<td>number</td>
<td>Any valid number (e.g. 1000)</td>
</tr>
<tr>
<td>array</td>
<td>If the type is array the value must be of the containing type. E.g. to set a custom field which defines multiple groups, the value <code>jira-users,jira-administrators</code> is mapped properly. The same is valid for versions: <code>18.0.3,19.0.0</code>.</td>
</tr>
</tbody>
</table>

As described above the values are usually identified by their name instead of their id (projects are identified by their key). This is easier to read, but may break the mapping code, if for example the name of a component changes in the future. To change the mapping from name (or key) to id an entry in `jira.properties` must be made:

```
jira.attributes.customfield_10113.resolution=id
```

To learn more about the Jira REST API please consult the following pages:

- [https://docs.atlassian.com/jira/REST/cloud/](https://docs.atlassian.com/jira/REST/cloud/)
The following jira (custom) fields have been tested with jira version 6.3.15:

- Checkboxes
- Date Picker
- Date Time Picker
- Group Picker (multiple groups)
- Group Picker (single group)
- Labels
- Number Field
- Project Picker (single project)
- Radio Buttons
- Select List (cascading)
- Select List (multiple choices)
- Select List (single choice)
- Text Field (multi-line)
- Text Field (read only)
- Text Field (single line)
- URL Field
- User Picker (multiple user)
- User Picker (single user)
- Version Picker (multiple versions)
- Version Picker (single version)

All other field types are mapped as is and therefore may not work.

Examples

The following output is the result of the command `opennms:jira-list-fields -h http://localhost:8080 -u admin -p testtest -k DUM -i Bug -s` and lists all available fields for project with key `DUM` and issue type `Bug`:  

---

416
Defined Components are core, service, web

Defined versions are 1.0.0 and 1.0.1

Defined issue types are Bug and Task

Defined priorities are Major and Minor

Defined projects are NMS and HZN

Defined options are yes, no and sometimes

The following snipped shows how to set the various custom fields:

ticket.addAttribute("components", "core,web"); ①
ticket.addAttribute("assignee", "ulf"); ②
ticket.addAttribute("fixVersions", "1.0.1"); ③
ticket.addAttribute("issueType", "Task"); ④
ticket.addAttribute("priority", "Minor"); ⑤
ticket.addAttribute("project", "HZN"); ⑥
ticket.addAttribute("summary", "Custom Summary"); ⑦
ticket.addAttribute("customfield_10100", "yes,no"); ⑧
ticket.addAttribute("customfield_10101", "2016-12-06"); ⑨

① Sets the components of the created issue to core and web.
② Sets the Asignee of the issue to the user with login ulf.
③ Sets the fix version of the issue to 1.0.1
④ Sets the issue type to Task, overwriting the value of jira.type.
⑤ Sets the priority of the created issue to Minor.
⑥ Sets the project to HZN, overwriting the value of jira.project.
⑦ Sets the summary to Custom Summary, overwriting any previous summary.
⑧ Checks the checkboxes yes and no.
⑨ Sets the value to 2016-12-06.

20.1.4. Troubleshooting

When troubleshooting, consult the following log files:

- ${OPENNMS_HOME}/data/log/karaf.log
- ${OPENNMS_HOME}/logs/trouble-ticketer.log

You can also try the opennms:jira-verify OSGI Command to help identifying problems in your configuration.

20.2. Remedy Ticketing Plugin

The Remedy Ticketing Plugin is used to create requests in the BMC Remedy ARS Help Desk Module in response to OpenNMS Horizon alarms.

20.2.1. Remedy Product Overview

It’s important to be specific when discussing Remedy, because BMC Remedy is a suite of products. The OpenNMS Horizon Remedy Ticketing Plugin requires the core Remedy ARS and the Help Desk Module. The Help Desk Module contains a Help Desk Interface Web Service, which serves as the endpoint for creating, updating, and fetching tickets.

The Help Desk Interface (HDI) Web Service requires extensive configuration for its basic operation, and may need additional customization to interoperate with the OpenNMS Horizon Remedy Ticketing Plugin. Contact your Remedy administrator for help with required configuration tasks.

20.2.2. Supported Remedy Product Versions

Currently supported Remedy product versions are listed below:

<table>
<thead>
<tr>
<th>Product</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remedy ARS</td>
<td>7.6.04 Service Pack 2</td>
</tr>
<tr>
<td>Help Desk Module</td>
<td>7.6.04 Service Pack 1</td>
</tr>
<tr>
<td>HDI Web Service</td>
<td>Same as Help Desk Module</td>
</tr>
</tbody>
</table>

20.2.3. Setup

The Remedy Ticketing Plugin and its dependencies are part of the OpenNMS Horizon core packages.

Start by enabling the plugin and the ticket controls in the OpenNMS Horizon web interface, by setting the following properties in `${OPENNMS_HOME}/etc/opennms.properties`: 

---

418
opennms.ticketer.plugin=org.opennms.netmg.ticke.remedy.RemedyTicketerPlugin
opennms.alarmTroubleTicketEnabled = true

In the same file, set the property opennms.alarmTroubleTicketLinkTemplate to a value appropriate for constructing a link to tickets in the Remedy web interface. A sample value is provided but must be customized for your site; the token `${id}` will be replaced with the Remedy ticket ID when the link is rendered.

Now configure the plugin itself by setting the following properties in ${OPENNMS_HOME}/etc/remedy.properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remedy.username</td>
<td>required</td>
<td>Username for authenticating to Remedy</td>
</tr>
<tr>
<td>remedy.password</td>
<td>required</td>
<td>Password for authenticating to Remedy</td>
</tr>
<tr>
<td>remedy.authentication</td>
<td>optional</td>
<td>Authentication style to use</td>
</tr>
<tr>
<td>remedy.locale</td>
<td>optional</td>
<td>Locale for text when creating and updating tickets</td>
</tr>
<tr>
<td>remedy.timezone</td>
<td>optional</td>
<td>Timezone for interaction with Remedy</td>
</tr>
<tr>
<td>remedy.endpoint</td>
<td>required</td>
<td>The endpoint URL of the HPD web service</td>
</tr>
<tr>
<td>remedy.portname</td>
<td>required</td>
<td>The Port name of the HPD web service</td>
</tr>
<tr>
<td>remedy.createendpoint</td>
<td>required</td>
<td>The endpoint location of the Create-HPD web service</td>
</tr>
<tr>
<td>remedy.createportname</td>
<td>required</td>
<td>The Port name of the Create-HPD web service</td>
</tr>
<tr>
<td>remedy.targetgroups</td>
<td>optional</td>
<td>Colon-separated list of Remedy groups to which created tickets may be assigned ({{group}} below refers to values from this list)</td>
</tr>
<tr>
<td>remedy.assignedgroup.{{group}}</td>
<td>optional</td>
<td>Assigned group for the target group {{group}}</td>
</tr>
<tr>

<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>remedy.reason.cancelled</td>
<td>required</td>
<td>The reason code set in Remedy when the ticket is cancelled in OpenNMS Horizon</td>
</tr>
</tbody>
</table>

The values for many of the required properties are site-specific; contact your Remedy administrator for assistance.

Restart OpenNMS Horizon.

The plugin should be ready to use. When troubleshooting, consult the following log files:

- `${OPENNMS_HOME}/logs/trouble-ticketer.log`

### 20.3. TSRM Ticketing Plugin

The *TSRM Ticketing Plugin* is used to create TSRM incidents in response to OpenNMS Horizon alarms.

#### 20.3.1. Setup

In order to enable the plugin start by setting following property in `${OPENNMS_HOME}/etc/opennms.properties`:

```properties
opennms.ticketer.plugin=org.opennms.netmgt.ticketd.OSGiBasedTicketerPlugin
```

Configure the plugin options by setting the following properties in `${OPENNMS_HOME}/etc/tsrm.properties`:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tsrm.url</td>
<td>TSRM Endpoint URL</td>
</tr>
<tr>
<td>tsrm.ssl.strict</td>
<td>Strict SSL Check (true/false)</td>
</tr>
<tr>
<td>tsrm.status.open</td>
<td>TSRM status for open ticket</td>
</tr>
<tr>
<td>tsrm.status.close</td>
<td>TSRM status for close ticket</td>
</tr>
</tbody>
</table>

Next, add `tsrm-troubleticketer` to the `featuresBoot` property in the `${OPENNMS_HOME}/etc/org.apache.karaf.features.cfg`.

Restart OpenNMS.

When OpenNMS has started again, login to the *Karaf Shell* and install the feature:

```sh
feature:install tsrm-troubleticketer
```
The plugin should be ready to use. When troubleshooting, consult the following log files:

- `${OPENNMS_HOME}/data/log/karaf.log`
- `${OPENNMS_HOME}/logs/trouble-ticketer.log`

### 20.3.2. Mapping OpenNMS Ticket with TSRM Incident

Following tables shows mapping between OpenNMS ticket and TSRM Incident

<table>
<thead>
<tr>
<th>Ticket Field</th>
<th>TSRM Incident Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>TICKETID</td>
</tr>
<tr>
<td>state</td>
<td>STATUS</td>
</tr>
<tr>
<td>summary</td>
<td>DESCRIPTION</td>
</tr>
<tr>
<td>details</td>
<td>DESCRIPTIONLONGDESCRIPTION</td>
</tr>
<tr>
<td>user</td>
<td>REPORTEDBY</td>
</tr>
</tbody>
</table>

Below fields are not part of Ticket, they have to be added as attributes.

<table>
<thead>
<tr>
<th>Ticket Field</th>
<th>TSRM Incident Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>affectedPerson</td>
<td>AFFECTEDPERSON</td>
</tr>
<tr>

</tr>
</tbody>
</table>
Chapter 21. Enabling RMI

By default, the RMI port in the OpenNMS Horizon server is disabled, for security reasons. If you wish to enable it so you can access OpenNMS Horizon through jconsole, remote-manage OpenNMS Horizon, or use the remote poller over RMI, you will have to add some settings to the default OpenNMS Horizon install.

21.1. Enabling RMI

To enable the RMI port in OpenNMS Horizon, you will have to add the following to the ${OPENNMS_HOME}/etc/opennms.conf file. If you do not have an opennms.conf file, you can create it.

```
# Configure remote JMX
ADDITIONAL_MANAGER_OPTIONS="$ADDITIONAL_MANAGER_OPTIONS
-Dcom.sun.management.jmxremote.port=18980"
ADDITIONAL_MANAGER_OPTIONS="$ADDITIONAL_MANAGER_OPTIONS
-Dcom.sun.management.jmxremote.local.only=false"
ADDITIONAL_MANAGER_OPTIONS="$ADDITIONAL_MANAGER_OPTIONS
-Dcom.sun.management.jmxremote.authenticate=true"
ADDITIONAL_MANAGER_OPTIONS="$ADDITIONAL_MANAGER_OPTIONS
-Dcom.sun.management.jmxremote.ssl=false"

# Listen on all interfaces
ADDITIONAL_MANAGER_OPTIONS="$ADDITIONAL_MANAGER_OPTIONS
-Dopennms.poller.server.serverHost=0.0.0.0"

# Accept remote RMI connections on this interface
ADDITIONAL_MANAGER_OPTIONS="$ADDITIONAL_MANAGER_OPTIONS
-Djava.rmi.server.hostname=<your-server-ip-address>"
```

This tells OpenNMS Horizon to listen for RMI on port 18980, and to listen on all interfaces. (Originally, RMI was only used for the Remote Poller, so despite the property name mentioning the "opennms poller server" it applies to RMI as a whole.) Note that you must include the -Djava.rmi.server.hostname= option or OpenNMS Horizon will accept connections on the RMI port, but not be able to complete a valid connection.

Authentication will only be allowed for users that are in the admin role (i.e. ROLE_ADMIN), or the jmx role (i.e. ROLE_JMX). To make a user an admin, be sure to add only the ROLE_ADMIN role to the user in users.xml. To add the jmx role to the user, add the ROLE_JMX role to the user in users.xml, and also the ROLE_USER role if is required to provide access to the WebUI.

Make sure ${OPENNMS_HOME}/etc/jmxremote.access has the appropriate settings:

```
admin  readwrite
jmx    readonly
```

The possible types of access are:
**readwrite**

Allows retrieving JMX metrics as well as executing MBeans.

**readonly**

Allows retrieving JMX metrics but does **not** allow executing MBeans, even if they just return simple values.

### 21.2. Enabling SSL

To enable SSL on the RMI port, you will need to have an existing keystore for the OpenNMS Horizon server. For information on configuring a keystore, please refer to the official *OpenNMS Horizon* Wiki article *Standalone HTTPS with Jetty*.

You will need to change the `com.sun.management.jmxremote.ssl` option to `true`, and tell OpenNMS Horizon where your keystore is.

```
# Configure remote JMX
ADDITIONAL_MANAGER_OPTIONS="$ADDITIONAL_MANAGER_OPTIONS
-Dcom.sun.management.jmxremote.port=18980"
ADDITIONAL_MANAGER_OPTIONS="$ADDITIONAL_MANAGER_OPTIONS
-Dcom.sun.management.jmxremote.local.only=false"
ADDITIONAL_MANAGER_OPTIONS="$ADDITIONAL_MANAGER_OPTIONS
-Dcom.sun.management.jmxremote.authenticate=true"
ADDITIONAL_MANAGER_OPTIONS="$ADDITIONAL_MANAGER_OPTIONS
-Dcom.sun.management.jmxremote.ssl=true"

# Configure SSL Keystore
ADDITIONAL_MANAGER_OPTIONS="$ADDITIONAL_MANAGER_OPTIONS
-Djavax.net.ssl.keyStore=/opt/opennms/etc/opennms.keystore"
ADDITIONAL_MANAGER_OPTIONS="$ADDITIONAL_MANAGER_OPTIONS
-Djavax.net.ssl.keyStorePassword=changeit"

# Listen on all interfaces
ADDITIONAL_MANAGER_OPTIONS="$ADDITIONAL_MANAGER_OPTIONS
-Dopennms.poller.server.serverHost=0.0.0.0"
# Accept remote RMI connections on this interface
ADDITIONAL_MANAGER_OPTIONS="$ADDITIONAL_MANAGER_OPTIONS
-Djava.rmi.server.hostname=<your-server-ip-address>"
```

### 21.3. Connecting to RMI over SSL

Note that if you are using a self-signed or otherwise untrusted certificate, you will need to configure a truststore on the client side when you attempt to connect over SSL-enabled RMI. To create a truststore, follow the example in the HTTPS client instructions in the operator section of the manual. You may then use the truststore to connect to your OpenNMS Horizon RMI server.

For example, when using `jconsole` to connect to the OpenNMS Horizon RMI interface to get JVM statistics, you would run:
jconsole -Djavax.net.ssl.trustStore=/path/to/opennms.truststore -Djavax.net.ssl.trustStorePassword=changeit
Chapter 22. Minion

22.1. Using JMS

By default, OpenNMS Horizon uses the JMS protocol with an ActiveMQ broker to communicate with Minions. This is used for both issuing remote procedure calls (RPCs, i.e. ping this host) and for transporting unsolicited messages such as SNMP traps and syslog messages. OpenNMS Horizon provides an embedded ActiveMQ broker to help simplify installation.

It is also possible (and recommended for large installations) to use an external broker.

22.1.1. Tuning the ActiveMQ broker

The settings for the embedded ActiveMQ broker are found in $OPENNMS_HOME/etc/opennms-activemq.xml. Memory and storage limits are conservative by default and should be tuned to accommodate your workload. Consider increasing the memoryUsage (defaults to 20MB) to 512MB or greater, assuming you have enough heap available.

If the memory limit is reached, flow control will prevent messages from being published to the broker.

22.1.2. Monitoring the ActiveMQ broker using the Karaf shell

The opennms:activemq-stats command available via the Karaf shell can be used to show statistics about the embedded broker:

```
opennms:activemq-stats
```

If the command is not available, try installing the feature using feature:install opennms-activemq-shell

This command reports some high level broker statistics as well as message, enqueue and dequeue counts for the available queues. Pay close attention to the memory usage that is reported. If the usage is high, use the queue statistics to help isolate which queue is consuming most of the memory.

The opennms:activemq-purge-queue command can be used to delete all of the available messages in a particular queue:

```
opennms:activemq-purge-queue OpenNMS.Sink.Trap
```

22.1.3. Authentication and authorization with ActiveMQ

The embedded ActiveMQ broker is pre-configured to authenticate clients using the same authentication mechanisms (JAAS) as the OpenNMS Horizon web application.
Users associated with the **ADMIN** role can read, write or create any queue or topic.

Users associated with the **MINION** role are restricted in such a way that prevents them from making RPC requests to other locations, but can otherwise read or write to the queues they need.

See the authorizationPlugin section in `$OPENNMS_HOME/etc/opennms-activemq.xml` for details.

### 22.1.4. Multi-tenancy with OpenNMS Horizon and ActiveMQ

The queue names used by OpenNMS Horizon are prefixed with a constant value. If many OpenNMS Horizon are configured to use the same broker, then these queues would end up being shared amongst the instances, which is not desired. In order to isolate multiple instances on the same broker, you can customize the prefix by setting the value of the `org.opennms.instance.id` system property to something that is unique per instance.

```bash
echo 'org.opennms.instance.id=MyNMS' > "$OPENNMS_HOME/etc/opennms.properties.d/instance-id.properties"
```

If you change the instance id setting when using the embedded broker, you will need to update the authorization section in the broker's configuration to reflect the updated prefix.

### 22.1.5. Tuning the RPC client in OpenNMS

The following system properties can be used to tune the thread pool used to issue RPCs:

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>org.opennms.ipc.rpc.threads</code></td>
<td>10</td>
<td>Number of threads which are always active.</td>
</tr>
<tr>
<td><code>org.opennms.ipc.rpc.threads.max</code></td>
<td>20</td>
<td>Maximum number of threads which can be active. These will exit after remaining unused for some period of time.</td>
</tr>
<tr>
<td><code>org.opennms.ipc.rpc.queue.max</code></td>
<td>1000</td>
<td>Maximum number of requests to queue. Set to -1 to be unlimited.</td>
</tr>
</tbody>
</table>

Use the `opennms:stress-rpc` Karaf shell command to help evaluate and tune performance.

### 22.1.6. Diagnosing RPC failures

Symptoms of RPC failures may include missed polls, missed data collection attempts and the inability to provision or re-scan existing nodes. For these reasons, it is important to ensure that RPC related communication with Minion at the various monitoring locations remains healthy.
If you want to verify that a specific location is operating correctly make sure that:

1. Nodes exist and were automatically provisioned for all of the Minions at the location
2. The Minion-Heartbeat, Minion-RPC and JMX-Minion services are online for one or more Minions at the location
3. Response time graphs for the Minion-RPC service are populated and contain reasonable values
   - These response time graphs can be found under the 127.0.0.1 response time resource on the Minion node
   - Values should typically be under 100ms but may vary based on network latency
4. Resource graphs for the JMX-Minion service are populated and reasonable values

To interactively test RPC communication with a remote location use the `opennms:poll` command from the Karaf shell:

```
opennms:poll -l LOCATION -c org.opennms.netmgt.poller.monitors.IcmpMonitor 127.0.0.1
```

Replace `LOCATION` in the command above with the name of the location you want to test.

### 22.2. Using AWS SQS

By default, OpenNMS Horizon uses an ActiveMQ broker to communicate with Minions. This broker is used for both issuing remote procedure calls (RPCs, ie. ping this host) and for transporting unsolicited messages such as SNMP traps and syslog messages.

AWS SQS can be used as an alternative to ActiveMQ for both remote procedure calls and transporting the unsolicited messages.

AWS SQS must be enabled on both OpenNMS Horizon and Minion to function.

#### 22.2.1. OpenNMS Horizon Configuration

Enable and configure the AWS SQS on OpenNMS Horizon by using the following commands. The `initialSleepTime` property will ensure that messages are not consumed from AWS SQS until the OpenNMS Horizon system has fully initialized.

```
echo 'org.opennms.core.ipc.rpc.strategy=sqs
org.opennms.core.ipc.sink.strategy=sqs
org.opennms.core.ipc.sink.initialSleepTime=60000
org.opennms.core.ipc.aws.sqs.aws_region=us-east-1' > "$OPENNMS_HOME/etc/opennms.properties.d/aws-sqs.properties"
```

AWS Credentials are required in order to access SQS. The default credential provider chain looks for credentials in this order:
• Environment Variables (i.e. `AWS_ACCESS_KEY_ID` and `AWS_SECRET_ACCESS_KEY`)

• Java system properties (i.e. `aws.accessKeyId` and `aws.secretKey`. These keys can be added to `$OPENNMS_HOME/etc/opennms.conf`)

• Default credential profiles file (i.e. `~/.aws/credentials`)

• Amazon ECS container credentials (i.e. `AWS_CONTAINER_CREDENTIALS_RELATIVE_URI`)

• Instance profile credentials (i.e. through the metadata service when running on EC2)

Alternatively, the credentials can be specified inside the `aws-sqs.properties` file:

```
echo 'org.opennms.core.ipc.aws.sqs.aws_access_key_id=XXXXXXXXXXX
org.opennms.core.ipc.aws.sqs.aws_secret_access_key=XXXXXXXXXXX' >>
"$OPENNMS_HOME/etc/opennms.properties.d/aws-sqs.properties"
```

When running OpenNMS inside AWS, it is possible to use the default provider chain with an IAM Role to avoid hard coding the AWS Credentials on a configuration file. The following shows an example of the role that should be associated with the EC2 instance on which OpenNMS is going to run:

If you require consistent ordering of the messages, you should use FIFO queues instead of Standard queues. You can enable FIFO queues by adding the following parameter to the `aws-sqs.properties` file referenced above:

```
org.opennms.core.ipc.aws.sqs.sink.FifoQueue=true
```

Restart *OpenNMS Horizon* to apply the changes.
22.2.2. Minion Configuration

Enable the AWS SQS on Minion using:

```
!minion-jms
!opennms-core-ipc-rpc-jms
!opennms-core-ipc-sink-camel
opennms-core-ipc-rpc-aws-sqs
opennms-core-ipc-sink-aws-sqs
```

> "$MINION_HOME/etc/featuresBoot.d/aws-sqs.boot"

The snippet above prevents the default JMS related features from starting and loads the SQS related features instead.

Next, configure AWS SQS on Minion using:

```
aws_region=us-east-1
aws_access_key_id=XXXXXXXXXXX
aws_secret_access_key=XXXXXXXXXXX
```

> "$MINION_HOME/etc/org.opennms.core.ipc.aws.sqs.cfg"

The AWS credentials are required. If they are not specified on the configuration file, the default credentials provider chain (explained above) will be used instead.

If you require consistent ordering to the messages, you should use FIFO queues instead of Standard queues. You can enable FIFO queues by adding the following parameter to the `org.opennms.core.ipc.aws.sqs.cfg` file referenced above:

```
sink.FifoQueue=true
```

Restart Minion to apply the changes.

---

AWS credentials are required when the Minion is not running inside a VPC.

The Minion SQS settings must match what OpenNMS currently has. This is particularly critical for the `FifoQueue` setting.

22.2.3. SQS Configuration Settings

From the Amazon SQS Documentation, the following tables list parameters which can be added to either Minion (via `MINION_HOME/etc/org.opennms.core.ipc.aws.sqs.cfg`) or OpenNMS Horizon (via `OPENNMS_HOME/etc/opennms.properties.d/aws-sqs.properties`), along with the correct syntax for each environment.
## Sink Settings

Queues used for reception of unsolicited messages (e.g. SNMP traps, syslog messages) are configured by setting properties with `sink` prepended to the SQS parameter name:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Notes</th>
<th>OpenNMS Horizon</th>
<th>Minion</th>
</tr>
</thead>
<tbody>
<tr>
<td>DelaySeconds</td>
<td>Default: 0 seconds</td>
<td><code>org.opennms.core.ipc.aws.sqs.sink.DelaySeconds</code></td>
<td><code>sink.DelaySeconds</code></td>
</tr>
<tr>
<td>VisibilityTimeout</td>
<td>Default: 30 seconds</td>
<td><code>org.opennms.core.ipc.aws.sqs.sink.VisibilityTimeout</code></td>
<td><code>sink.VisibilityTimeout</code></td>
</tr>
<tr>
<td>Policy</td>
<td>-</td>
<td><code>org.opennms.core.ipc.aws.sqs.sink.Policy</code></td>
<td><code>sink.Policy</code></td>
</tr>
<tr>
<td>RedrivePolicy</td>
<td>-</td>
<td><code>org.opennms.core.ipc.aws.sqs.sink.RedrivePolicy</code></td>
<td><code>sink.RedrivePolicy</code></td>
</tr>
<tr>
<td>KmsMasterKeyId</td>
<td>-</td>
<td><code>org.opennms.core.ipc.aws.sqs.sink.KmsMasterKeyId</code></td>
<td><code>sink.KmsMasterKeyId</code></td>
</tr>
<tr>
<td>KmsDataKeyReusePeriodSeconds</td>
<td>-</td>
<td><code>org.opennms.core.ipc.aws.sqs.sink.KmsDataKeyReusePeriodSeconds</code></td>
<td><code>sink.KmsDataKeyReusePeriodSeconds</code></td>
</tr>
<tr>
<td>FifoQueue</td>
<td>Default: false</td>
<td><code>org.opennms.core.ipc.aws.sqs.sink.FifoQueue</code></td>
<td><code>sink.FifoQueue</code></td>
</tr>
<tr>
<td>ContentBasedDeduplication</td>
<td>Valid only when <code>sink.FifoQueue</code> is true</td>
<td><code>org.opennms.core.ipc.aws.sqs.sink.ContentBasedDeduplication</code></td>
<td><code>sink.ContentBasedDeduplication</code></td>
</tr>
</tbody>
</table>

## RPC Settings

Queues used for provisioning, service polling, data collection, and other concerns apart from unsolicited message reception are configured by setting properties with `rpc` prepended to the SQS parameter name:
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Notes</th>
<th>OpenNMS Horizon</th>
<th>Minion</th>
</tr>
</thead>
<tbody>
<tr>
<td>DelaySeconds</td>
<td>Default: 0 seconds</td>
<td>org.opennms.core.ipc.aws.sqs.rpc.DelaySeconds</td>
<td>rpc.DelaySeconds</td>
</tr>
<tr>
<td>VisibilityTimeout</td>
<td>Default: 30 seconds</td>
<td>org.opennms.core.ipc.aws.sqs.rpc.VisibilityTimeout</td>
<td>rpc.VisibilityTimeout</td>
</tr>
<tr>
<td>Policy</td>
<td>-</td>
<td>org.opennms.core.ipc.aws.sqs.rpcPolicy</td>
<td>rpc.Policy</td>
</tr>
<tr>
<td>RedrivePolicy</td>
<td>-</td>
<td>org.opennms.core.ipc.aws.sqs.rpc.RedrivePolicy</td>
<td>rpc.RedrivePolicy</td>
</tr>
<tr>
<td>KmsMasterKeyId</td>
<td>-</td>
<td>org.opennms.core.ipc.aws.sqs.rpc.KmsMasterKeyId</td>
<td>rpc.KmsMasterKeyId</td>
</tr>
<tr>
<td>KmsDataKeyReusePeriodSeconds</td>
<td>-</td>
<td>org.opennms.core.ipc.aws.sqs.rpc.KmsDataKeyReusePeriodSeconds</td>
<td>rpc.KmsDataKeyReusePeriodSeconds</td>
</tr>
<tr>
<td>FifoQueue</td>
<td>Default: false</td>
<td>org.opennms.core.ipc.aws.sqs.rpc.FifoQueue</td>
<td>rpc.FifoQueue</td>
</tr>
<tr>
<td>ContentBasedDeduplication</td>
<td>Valid only when rpc.FifoQueue is true</td>
<td>org.opennms.core.ipc.aws.sqs.rpc.ContentBasedDeduplication</td>
<td>rpc.ContentBasedDeduplication</td>
</tr>
</tbody>
</table>

When FIFO queues are not required, there is no need to add `FifoQueue=false` to the configuration files, as this is the default behavior.

### 22.2.4. Managing Multiple Environments

In order to support multiple OpenNMS Horizon environments in a single AWS region, the `aws_queue_name_prefix` property can be used to prefix the queue names.

For example, if we set this property to be "PROD", the queue names will resemble `PROD-OpenNMS-Sink-Heartbeat`, instead of `OpenNMS-Sink-Heartbeat`.

This property must be properly configured at OpenNMS Horizon and Minion side.
22.2.5. AWS Credentials

The credentials (a.k.a. the Access Key ID and the Secret Access Key) are required in both sides, OpenNMS and Minion.

In order to create credentials just for accessing SQS resources, follow this procedure:

- From the AWS Console, choose the appropriate region.
- Open the IAM Dashboard and click on "Add user".
- Choose a name for the user, for example opennms-minion.
- Check only Programmatic access for the Access type.
- On the permissions, click on Attach existing policies directly.
- On the search bar, write SQS, and then check on AmazonSQSFullAccess.
- Click on Create User

Finally, either click on Download .csv or click on "Show" to grab a copy of the Access key ID, and the Secret access key.

22.2.6. Limitations

There are a number of limitations when using AWS SQS, in particular:

- A message can include only XML, JSON, and unformatted text. The following Unicode characters are allowed: \x9 | \xA | \xD | \x20 to \xD7FF | \xE000 to \xFFFD | \x10000 to \x10FFFF. Any characters not included in this list are rejected.
- The minimum message size is 1 byte (1 character). The maximum is 262,144 bytes (256 KB).
Without batching, FIFO queues can support up to 300 messages per second (300 send, receive, or delete operations per second).

See [Amazon SQS Limits](https://aws.amazon.com/sqs/) for further details.

**Location names**

Queue names in *AWS SQS* are limited to 80 characters. When issuing remote procedure calls, the target location is used as part of the queue name. For this reason, it is important that:

- The length of the location name and queue name prefix (if used) must not exceed 32 characters in aggregate.
- Both the location name and queue name prefix (if used) may only contain alphanumeric characters, hyphens (-), and underscores (_).

22.3. Using Off-heap Storage for Sink Messages

If a Minion loses connectivity with the broker (i.e. Kafka or ActiveMQ), then any received messages (i.e. syslog, flows, SNMP traps) are queued until connectivity is restored. This queue is limited by a fixed (and configurable) number of messages queued in the JVM heap and can optionally queue additional messages by persisting directly to the filesystem avoiding heap memory usage. Once the queue is full, additional messages will be dropped.

The off-heap storage feature allows us to extend the storage capacity by queuing messages outside of the JVM heap.

22.3.1. Configuring Off-heap Storage

Configure storage limits:

```bash
echo 'offHeapSize = 1GB
entriesAllowedOnHeap = 100000
offHeapFilePath =' > "$MINION_HOME/etc/org.opennms.core.ipc.sink.offheap.cfg"
```

A file will be created for each module and the configuration will be applied to each module individually. Therefore setting a size of 1GB for example means that the maximum size for each module's file is 1GB not that the total for all modules is 1GB.

The number of entries allowed to be queued on the heap can be controlled by setting the `entriesAllowedOnHeap` value.

Specify `offHeapSize` in KB, MB or GB. For example: 1, 128MB, 65536KB. The size specified must be a power of 2. For example 128MB is a valid value but 140MB is not.

The `offHeapSize` can also be left empty or set to 0 to disable queueing off heap. In this case only heap memory will be used for queueing.

The `offHeapFilePath` should be set to the path where the queue files should be stored and defaults
22.4. Installing JDBC drivers in Minion

For any JDBC service to be detected/pollled/collected, corresponding JDBC driver needs to be installed in Minion. Following are steps to install JDBC driver.

- JDBC driver jar needs to be copied into minion/repositories/default by following maven repositories pattern. For ex: Mysql driver jar should be placed in repositories/core/mysql/mysql-connector-java/8.0.15/mysql-connector-java-8.0.15.jar
- Install the JDBC driver jar as a feature. Modify contents of following features-jdbc.xml relevant to JDBC driver that is getting installed. Copy features-jdbc.xml file into ${MINION_HOME}/deploy/.
  Multiple JDBC drivers can be added to this file each one as a new feature.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<features
    name="opennms-${project.version}"
    xmlns="http://karaf.apache.org/xmlns/features/v1.4.0"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://karaf.apache.org/xmlns/features/v1.4.0
                        http://karaf.apache.org/xmlns/features/v1.4.0"
>  <!-- Bootstrap mysql bundle to get loaded by default in minion -->
  <feature name="mysql-bundle" version="8.0.15" install="auto">
    <bundle>wrap:mvn:mysql/mysql-connector-java/8.0.15</bundle>
  </feature>
</features>
```

- Restart Minion with: systemctl restart minion and that should load the JDBC driver.

22.5. Time to Live (TTL) for RPCs

Remote procedure calls (RPCs) between OpenNMS Horizon and Minion include a time limit which, if exceeded, aborts the requests and discards any subsequent responses. We call this limit the time-to-live or TTL. We make an effort to use logical values where possible and provide means to configure the TTLs for circumstances where the default values are not suitable (i.e. for interacting with devices or locations with high latency).

Our modules and services have different rules for determining the TTL.

To troubleshoot TTLs, consider enabling the OpenTracing integration on both OpenNMS Horizon and Minion.
22.5.1. TTLs in Pollerd & Collectd

The TTL used when invoking monitors and collectors remotely is:

1. The value from the `ttl` parameter associated with the service
2. Fall-back to using the service interval as the TTL (this is the rate at which the service is scheduled)

These rules apply to all monitors and collectors, excluding the SnmpCollector.

22.5.2. TTLs for the SNMP Collector

The TTL used when invoking the SnmpCollector remotely is:

1. The value of the `ttl` associate with the SNMP agent's configuration
2. Fall-back to using the service interval as the TTL (this is the rate at which the service is scheduled)

22.5.3. TTLs for the other SNMP communication

The TTL used when invoking other types of SNMP requests remotely is:

1. The value of the `ttl` associate with the SNMP agent's configuration
2. Fall-back to using the service interval as the TTL (this is the rate at which the service is scheduled)

These rules apply to SNMP queries like agent scans in provisiond, table scans in enlinkd, etc...

22.5.4. TTLs for Provisiond Detectors

The TTL used when invoking detectors remotely is:

1. The value from the `ttl` parameter associated with the detector
2. Fall-back to using the global default TTL

22.5.5. Global TTL

For cases where we cannot derive a suitable TTL, a global value is used which defaults to 20000 (20 seconds). This value can be configured. When using the JMS-based RPC implementation, set value of the `org.opennms.jms.timeout` system property to the desired number of milliseconds. When using the Kafka-based RPC implementation, set the value of the `org.opennms.core.ipc.rpc.kafka.ttl` system property to the desired number of milliseconds.

22.5.6. Using meta-data for TTLs

For RPCs that derive TTLs from service parameters, the `meta-data` feature can be used to customize these values on a node/interface/service basis.
For example, the ICMP detector could be configured to use the value of the `ttl` associated with the node meta-data, or default to 30 seconds if none is setup as follows:

```
<detector name="ICMP" class="org.opennms.netmgt.provision.detector.icmp.IcmpDetector">
  <parameter key="ttl" value="${requisition:ttl|300000}"/>
</detector>
```
Chapter 23. Sentinel

The goal of Sentinel is to scale out and distribute individual components from OpenNMS Horizon.

⚠️ The sentinel feature is still in development and this is only a very rough documentation, not covering all aspects. Please refer to the Limitations section for more details

23.1. Limitations

Currently Sentinel is in a very early state of development and therefore the usage is limited:

- Only allows distribution of Telemetryd functionality (such as processing flows, or use the existing telemetry adapters to store measurements data to Newts)
- Requires a Minion to work as a (message) producer
- In most cases, it is advised to disable those adapters and listeners in OpenNMS Horizon if they are also running by a Sentinel instance.

23.2. Installation

If Minion is working, the groundwork for Sentinel is already done. For more details on how to install Sentinel refer to the Installation Guide.

23.3. Clean Start

On each start the cache of the Sentinel is cleared, that means the container returns in its original state. To disable this functionality set karaf.clean.cache = false in ${SENTINEL_HOME}/etc/system.properties.

23.4. Configuration

It is assumed, that the Sentinel container is running on a different system than the OpenNMS Horizon and Minion. Therefore at least the following configurations are necessary:

- Configure the datasource to connect to the Postgres database
- Configure the controller (identity and connection to communicate with OpenNMS - same as for Minion)
- Configure the communication layer (for now either JMS or Kafka)
- Install features

23.4.1. Configure the datasource

This is required in order to have Sentinel connect to the PostgreSQL database OpenNMS Horizon.
23.4.2. Configure the controller

```
config:edit org.opennms.sentinel.controller
config:property-set location SENTINEL
config:property-set id 00000000-0000-0000-0000-000000dab11
config:property-set http-url http://127.0.0.1:8980/opennms
config:property-set broker-url failover:tcp://127.0.0.1:61616
config:update
```

① used only for tracing, must be provided
② used only for tracing, must be provided
③ url which points to OpenNMS Horizon (required)
④ url which points to the OpenNMS Horizon Active MQ Broker (only required if using feature `sentinel-jms`, otherwise may be omitted)

Basically the same properties as for the Minion Controller are supported, but must be placed in config file `org.opennms.sentinel.controller.cfg` instead of `org.opennms.minion.controller.cfg`.

23.4.3. Configure Connectivity

By default the Sentinel consumes messages from the OpenNMS Horizon ActiveMQ Broker. See Configure the Controller for more details.

As with Minion the Sentinel can also be configured to consume messages from Kafka.

Using Kafka

When Using Sentinel with Kafka the same rules for using Kafka with Minions apply.

Kafka Configuration

Each Minion works as a Producer and must be configured beforehand. Please refer to section Minion Kafka Producer Configuration on how to configure Minion as a Kafka Producer.

Each Sentinel works as a Consumer and can be configured in the file `${SENTINEL_HOME}/etc/org.opennms.core.ipc.sink.kafka.consumer.cfg`. Either manually or via the `config:edit org.opennms.core.ipc.sink.kafka.consumer` statement. For supported properties, see here.
By default each *Kafka Consumer* starts consuming messages immediately after the feature has been started. It is possible to set a property `org.opennms.core.ipc.sink.initialSleepTime` to define an initial sleep time in ms before any messages are consumed. In order to set this up, please add an entry to the end of the file `${SENTINEL_HOME}/etc/system.properties`:

```
# Initial delay of 5 seconds before consuming of messages is started in milliseconds
org.opennms.core.ipc.sink.initialSleepTime=5000
```

### 23.4.4. Available features

The following list contains some features which may be installed manually:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sentinel-core</td>
<td>true</td>
<td>Base feature, installing all required bundles such as <code>opennms:health-check</code> and service requirements for other bundles, e.g. <code>sentinel-persistence</code>.</td>
</tr>
<tr>
<td>sentinel-jms</td>
<td>false</td>
<td>Provides connectivity to the OpenNMS Horizon <em>ActiveMQ</em> Broker.</td>
</tr>
<tr>
<td>sentinel-kafka</td>
<td>false</td>
<td>Provides connectivity to <em>Kafka</em>.</td>
</tr>
<tr>
<td>sentinel-flows</td>
<td>false</td>
<td>Feature which starts all dependencies to start processing flows.</td>
</tr>
<tr>
<td>sentinel-newts</td>
<td>false</td>
<td>Provides functionality to persist measurement data to <em>Newts</em>.</td>
</tr>
<tr>
<td>sentinel-telemetry-nxos</td>
<td>false</td>
<td>Allows using the <code>NxosGpbAdapter</code></td>
</tr>
<tr>
<td>sentinel-telemetry-jti</td>
<td>false</td>
<td>Allows using the <code>JtiGpbAdapter</code></td>
</tr>
<tr>
<td>sentinel-telemetry-bmp</td>
<td>false</td>
<td>Allows using the <code>BmpTelemetryAdapter</code></td>
</tr>
</tbody>
</table>

### 23.4.5. Auto install

In some cases it is desired to automatically configure the *Sentinel* instance and also start required features/bundles. As *Sentinel* is based on *Apache Karaf* - which supports auto deployment by simply copying any kind of data to the `deploy` folder, *Sentinel* can make use of that mechanism to enable auto or hot deployment.

In order to do so, in most cases it is sufficient to copy a `features.xml` file to `${SENTINEL_HOME}/deploy`. This can be done even if the container is running.
The chapter *Configure Flow Processing* contains an example on how to automatically start them with *Sentinel*.

### 23.4.6. Auto Start

In some cases it might not be sufficient to auto-deploy/configure the container with a *features.xml* file. If more flexibility is required it is suggested to modify/copy `.cfg` and `.properties` files directly to the `${SENTINEL_HOME}/etc` directory. To automatically start features with the container, the file `${SENTINEL_HOME}/etc/org.apache.karaf.features.cfg` must be updated:

```plaintext
# ...
defeaturesBoot = \
    (aries-blueprint, \
    deployer), \
    instance/4.2.2, \
    package/4.2.2, \
    log/4.2.2, \
    scv/26.1.3-SNAPSHOT, \
    ssh/4.2.2, \
    framework/4.2.2, \
    system/4.2.2, \
    eventadmin/4.2.2, \
    feature/4.2.2, \
    shell/4.2.2, \
    management/4.2.2, \

# ....
```

① Install and Start JMS communication feature

② Install and Start Sentinel Flows feature
23.4.7. Health Check / Troubleshooting

The `opennms:health-check` command allows to verify the health of the Sentinel container. It performs various health checks depending on the installed features to calculate the overall container health. For more information please try `opennms:health-check --help`.

<table>
<thead>
<tr>
<th>Information</th>
<th>In order to run the <code>opennms:health-check</code> command, the feature <code>sentinel-core</code> must be installed.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Information</td>
<td>This is also available in Minion Containers and will replace the now deprecated command <code>minion:ping</code>.</td>
</tr>
</tbody>
</table>

23.5. Flow Processing

In order to process flows via Sentinel ensure that OpenNMS Horizon, Minion and Sentinel are all installed according to the official Installation Guide.

Afterwards the following configuration examples help setting everything up.

23.5.1. Configure Sentinel

In order to process flows, Sentinel must start appropriate flow adapters. In Sentinel flow adapters are configured by either be placing a `.cfg` file in `${SENTINEL_HOME}/etc` or via `config:edit` statement.

The following example will configure the consumption of Netflow5 flows and saves the configuration in `${SENTINEL_HOME}/etc/org.oennms.features.telemetry.adapters-netflow5.cfg`.

First login to the Karaf Shell

```
$ ssh -p 8301 admin@localhost
```

```
admin@sentinel> config:edit --alias netflow5 --factory org.opennms.features.telemetry.adapters
admin@sentinel> config:property-set name Netflow-5
admin@sentinel> config:property-set adapters.0.name Netflow-5-Adapter
admin@sentinel> config:property-set adapters.0.class-name org.opennms.netmgt.telemetry.protocols.netflow.adapter.netflow5.Netflow5Adapter
admin@sentinel> config:update
```

Afterwards the feature `sentinel-flows` can be installed:

```
admin@sentinel> feature:install sentinel-jms
depends_on: sentinel-jms
admin@sentinel> feature:install sentinel-flows
```

① or `sentinel-kafka`
Only processing of **Netflow5** flows has been tested.

To check everything is working as expected, run the `opennms:health-check` command, e.g.:

```
admin@sentinel> opennms:health-check
Verifying the health of the container

Verifying installed bundles [ Success ]
Connecting to JMS Broker [ Success ]
Connecting to OpenNMS ReST API [ Success ]
Retrieving NodeDao [ Success ]
Connecting to ElasticSearch ReST API (Flows) [ Success ]

=> Everything is awesome
```

### 23.5.2. Configure Minion

The *Minion* must be configured to listen to incoming flow packages, e.g.:

```
$ ssh -p 8201 admin@localhost
```

```
admin@minion()> config:edit --alias udp-8877 --factory org.opennms.features.telemetry.listeners
admin@minion()> config:property-set name Netflow-5
admin@minion()> config:property-set class-name org.opennms.netmgt.telemetry.listeners.UdpListener
admin@minion()> config:property-set parameters.port 8877
admin@minion()> config:property-set parsers.0.name Netflow-5-Parser
admin@minion()> config:property-set parsers.0.class-name org.opennms.netmgt.telemetry.protocols.netflow.parser.Netflow5UdpParser
admin@minion()> config:update
```

> The name of the listener, in this case **Netflow-5** must match with the name of the adapter configuration in the *Sentinel* container.

### 23.5.3. Configure OpenNMS

*OpenNMS Horizon* must expose its *ActiveMQ Broker* to have a *Minion* and *Sentinel* connect to it. This can be done in `$OPENNMS_HOME/etc/opennms-activemq.xml`. For more details please refer to the Minion Installation Guide.

### 23.5.4. Auto configure flow processing for Sentinel

The following examples illustrate a `features.xml` which configures the *Sentinel* instance and automatically starts all required features to either consume messages via JMS (*ActiveMQ*) or *Kafka*.
Simply copy it to `${SENTINEL_HOME}/deploy/`. 
<?xml version="1.0" encoding="UTF-8"?>
<features
    name="opennms-${project.version}"
    xmlns="http://karaf.apache.org/xmlns/features/v1.4.0"
    xmlns:xs="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://karaf.apache.org/xmlns/features/v1.4.0 http://karaf.apache.org/xmlns/features/v1.4.0"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
    <!-- Bootstrap feature to start all flow related features automatically -->
    <feature name="autostart-sentinel-flows" version="${project.version}" start-level="100" install="auto">
        <!-- Configure the controller itself -->
        <config name="org.opennms.sentinel.controller">
            location = SENTINEL
            id = 00000000-0000-0000-0000-000000ddba11
            http-url = http://127.0.0.1:8980/opennms
            broker-url = failover:tcp://127.0.0.1:61616
        </config>

        <!-- Configure datasource connection -->
        <config name="org.opennms.netmgt.distributed.datasource">
            datasource.url = jdbc:postgresql://localhost:5432/opennms
            datasource.username = postgres
            datasource.password = postgres
            datasource.databaseName = opennms
        </config>

        <!-- Starts the Netflow5Adapter to process Netflow5 Messages. Be aware, that this requires a Listener with name "Netflow-5" on the Minion-side to have messages processed properly. -->
        <config name="org.opennms.features.telemetry.adapters-netflow5">
            name = Netflow-5
            class-name = org.opennms.netmgt.telemetry.adapters.netflow.v5.Netflow5Adapter
        </config>

        <!-- Point sentinel to the correct elastic endpoint -->
        <config name="org.opennms.features.flows.persistence.elastic">
            elasticUrl = http://elasticsearch:9200
        </config>

        <!-- Install JMS related features -->
        <feature>sentinel-jms</feature>

        <!-- Install Flow related features -->
        <feature>sentinel-flows</feature>
    </feature>
</features>
<?xml version="1.0" encoding="UTF-8"?>
<features
    name="opennms-${project.version}"
    xmlns="http://karaf.apache.org/xmlns/features/v1.4.0"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://karaf.apache.org/xmlns/features/v1.4.0 http://karaf.apache.org/xmlns/features/v1.4.0"
>
    <!-- Bootstrap bootstrap feature to start all flow related features automatically -->
    <feature
        name="autostart-sentinel-telemetry-flows" version="$\{project.version}" start-level="200" install="auto">
        <!-- Configure the controller itself -->
        <config
            name="org.opennms.sentinel.controller">
            location = SENTINEL
            id = 00000000-0000-0000-0000-000000ddba11
            http-url = http://127.0.0.1:8980/opennms
            broker-url = failover:tcp://127.0.0.1:61616
        </config>

        <!-- Configure datasource connection -->
        <config
            name="org.opennms.netmgt.distributed.datasource">
            datasource.url = jdbc:postgresql://localhost:5432/opennms
            datasource.username = postgres
            datasource.password = postgres
            datasource.databaseName = opennms
        </config>

        <!-- Starts the Netflow5Adapter to process Netflow5 Messages. Be aware, that this requires a Listener with name "Netflow-5" on the Minion-side to have messages processed properly. -->
        <config
            name="org.opennms.features.telemetry.adapters-netflow5">
            name = Netflow-5
            class-name = org.opennms.netmgt.telemetry.adapters.netflow.v5.Netflow5Adapter
        </config>

        <!-- Point sentinel to the correct elastic endpoint -->
        <config
            name="org.opennms.features.flows.persistence.elastic">
            elasticUrl = http://elasticsearch:9200
        </config>

        <!-- Configure as Kafka Consumer. All properties described at https://kafka.apache.org/0100/documentation.html#newconsumerconfigs are supported. -->
        <config
            name="org.opennms.core.ipc.sink.kafka.consumer">
            group.id = OpenNMS
        </config>
    </feature>
</features>
23.6. Persisting Collection Sets to Newts

In the previous chapter it is described on how to setup OpenNMS Horizon, Minion and Sentinel in order to distribute the processing of flows. However, it only covered flow processing adapters, but there are more, e.g. the NxosGpbAdapter, which can also be run on a Sentinel.

23.6.1. Adapters

This chapter describes the various adapters which may contain sample data which may be stored to a Persistence Storage and can also run on a Sentinel. At the moment only Newts is supported as a Persistence Storage. See chapter Configure Newts on how to configure Newts.

In order to get it to work properly, please note, that an appropriate listener on the Minion must also be configured. The name of the listener should share the same name on Sentinel.

SFlowTelemetryAdapter

In order to use this adapter, the feature sentinel-flows and sentinel-newts must be installed. In addition either sentinel-jms or sentinel-kafka should be installed and configured properly. See the previous Flow Processing chapter for more details.

If only sample data should be persisted, the following commands can be run on the Sentinel's Karaf Shell

```
$ ssh -p 8301 admin@localhost
```
If SFlow flows and the sample data should be processed, multiple adapters can be configured:

```bash
config:edit --alias sflow-telemetry --factory org.opennms.features.telemetry.adapters
config:property-set name SFlow
config:property-set adapters.1.name SFlow-Adapter
config:property-set adapters.1.class-name org.opennms.netmgt.telemetry.adapters.netflow.sflow.SFlowAdapter
config:property-set adapters.2.name SFlow-Telemetry
config:property-set adapters.2.class-name org.opennms.netmgt.telemetry.adapters.netflow.sflow.SFlowTelemetryAdapter
config:property-set adapters.2.parameters.script /opt/sentinel/etc/sflow-host.groovy
config:update
```

Please note, that in both cases the file `/opt/sentinel/etc/sflow-host.groovy` must be provided manually, e.g. by manually copying it over from OpenNMS Horizon.

**NxosGpbAdapter**

In order to use this adapter, the feature `sentinel-telemetry-nxos` and `sentinel-newts` must be installed. In addition either `sentinel-jms` or `sentinel-kafka` should be installed and configured properly. See the previous Flow Processing chapter for more details.

Besides this, configuration files from OpenNMS Horizon must be copied to Sentinel to `/opt/sentinel/etc`. The following files and directories are required:

- `${OPENNMS_HOME}/etc/datacollection`
- `${OPENNMS_HOME}/etc/datacollection-config.xml`
- `${OPENNMS_HOME}/etc/resource-types.d`

Afterwards the adapter can be set up:

```bash
$ ssh -p 8301 admin@localhost
```
Please note, that the file /opt/sentinel/etc/cisco-nxos-telemetry-interface.groovy must also be provided manually, e.g. by manually copying it over from OpenNMS Horizon.

**JtiGpbAdapter**

In order to use this adapter, the feature sentinel-telemetry-jti and sentinel-newts must be installed. In addition either sentinel-jms or sentinel-kafka should be installed and be configured properly. See the previous Flow Processing chapter for more details.

Besides this, configuration files from OpenNMS Horizon must be copied to Sentinel to /opt/sentinel/etc. The following files and directories are required:

- ${OPENNMS_HOME}/etc/datacollection
- ${OPENNMS_HOME}/etc/datacollection-config.xml
- ${OPENNMS_HOME}/etc/resource-types.d

Afterwards the adapter can be set up:

```bash
$ ssh -p 8301 admin@localhost
```

Please note, that the file /opt/sentinel/etc/junos-telemetry-interface.groovy must also be provided manually, e.g. by manually copying it over from OpenNMS Horizon.

### 23.6.2. Configure Newts

The configuration of Newts for Sentinel uses the same properties as for OpenNMS Horizon. The only difference is, that the properties for Sentinel are stored in /opt/sentinel/etc/org.opennms.newts.config.cfg instead of *.properties files. The name of each
property is the same as for OpenNMS Horizon without the `org.opennms.newts.config` prefix. The following example shows a custom Newts configuration using the Sentinel's Karaf Shell.

```
$ ssh -p 8301 admin@localhost

admin@sentinel> config:edit org.opennms.newts.config
admin@sentinel> config:property-set hostname localhost
admin@sentinel> config:property-set port 9042
admin@sentinel> config:property-set cache.strategy org.opennms.netmgmt.newts.support.GuavaSearchableResourceMetadataCache
admin@sentinel> config:update
```
Chapter 24. Special Cases and Workarounds

24.1. Overriding SNMP Client Behavior

By default, the SNMP subsystem in OpenNMS Horizon does not treat any RFC 3416 error-status as fatal. Instead, it will attempt to continue the request, if possible. However, only a subset of errors will cause OpenNMS Horizon's SNMP client to attempt retries. The default SNMP error-status handling behavior is as follows:

Table 130. Default SNMP Error Status Behavior

<table>
<thead>
<tr>
<th>error-status</th>
<th>Fatal</th>
<th>Retry</th>
</tr>
</thead>
<tbody>
<tr>
<td>noError(0)</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>tooBig(1)</td>
<td>false</td>
<td>true</td>
</tr>
<tr>
<td>noSuchName(2)</td>
<td>false</td>
<td>true</td>
</tr>
<tr>
<td>badValue(3)</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>readOnly(4)</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>genErr(5)</td>
<td>false</td>
<td>true</td>
</tr>
<tr>
<td>noAccess(6)</td>
<td>false</td>
<td>true</td>
</tr>
<tr>
<td>wrongType(7)</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>wrongLength(8)</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>wrongEncoding(9)</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>wrongValue(10)</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>noCreation(11)</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>inconsistentValue(12)</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>resourceUnavailable(13)</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>commitFailed(14)</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>undoFailed(15)</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>authorizationError(16)</td>
<td>false</td>
<td>true</td>
</tr>
<tr>
<td>notWritable(17)</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>inconsistentName(18)</td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

You can override this behavior by setting a property inside `${OPENNMS_HOME}/etc/opennms.properties` in the form:
For example, to make `authorizationError(16)` abort and not retry, you would set:

```
org.opennms.netmgt.snmp.errorStatus.16.fatal=true
org.opennms.netmgt.snmp.errorStatus.16.retry=false
```
Chapter 25. IFTTT Integration

The free web-based service IFTTT allows to combine web applications using simple conditional instructions. Each supported service has several triggers that can be used to trigger actions of other services. This allows for example to change brightness and color of a smart bulb, send messages or date to IoT devices.

The OpenNMS Horizon integration makes uses of the so-called "Webhooks" service, that allows to trigger actions when a specific web-request was received. The basic operation is as follows: OpenNMS Horizon polls for alarms and matches the alarm reduction key against a given filter and the alarm’s associated nodes against a given category filter. For the resulting alarm set the maximum severity and total count is computed. If one of these values changed compared to the last poll one or more events specified for the computed maximum severity will be sent to IFTTT.

25.1. IFTTT Configuration

In order to use the IFTTT integration in OpenNMS Horizon you need an IFTTT account. With this account you are able to create so-called applets that combine a trigger with an action. In our case we use the "Webhooks" service as the trigger and define the event name OpenNMS. After this step you can combine this trigger with any of the possible supported services and their actions.

Webhooks service trigger definition
In your account service settings for the "Webhooks" service you find your key in the given service URL. In the following example this key is X71dfUZsH4WkI6cjsLi9dV.

Webhooks service settings
On the side of *OpenNMS Horizon* you need a configuration that defines which event names to send on an alarm count or severity change. The configuration file `ifttt-config.xml` contains so-called trigger packages.

The operation is as follows: *OpenNMS Horizon* retrieves all alarms that have a node associated. Each trigger package defines whether only acknowledged alarms should be taken into account. It then computes the maximum severity and alarm count for each trigger package's category filter and reduction key filter. After that it triggers all events defined in the corresponding trigger sets for the computed maximum severity. The category and reduction key filter accepts Java regular expressions. Using an empty category filter will use all unacknowledged alarms regardless of whether these alarms have nodes assigned or not.

Each trigger inside a trigger set defines the event name to be triggered and three additional values. These values can be used to set additional attributes for the corresponding `IFTTT` applet action. The following trigger sets can be defined:

<table>
<thead>
<tr>
<th>Name</th>
<th>Execution</th>
</tr>
</thead>
<tbody>
<tr>
<td>ON</td>
<td>on start of the <code>IFTTT</code> alarm polling daemon to switch on a device</td>
</tr>
<tr>
<td>OFF</td>
<td>on stop of the <code>IFTTT</code> alarm polling daemon to switch off a device</td>
</tr>
<tr>
<td>NORMAL</td>
<td>if severity is NORMAL</td>
</tr>
<tr>
<td>Name</td>
<td>Execution</td>
</tr>
<tr>
<td>-------</td>
<td>-------------------------------</td>
</tr>
<tr>
<td>WARNING</td>
<td>if severity is WARNING</td>
</tr>
<tr>
<td>MINOR</td>
<td>if severity is MINOR</td>
</tr>
<tr>
<td>MAJOR</td>
<td>if severity is MAJOR</td>
</tr>
<tr>
<td>CRITICAL</td>
<td>if severity is CRITICAL</td>
</tr>
</tbody>
</table>

There are also **ON** and **OFF** available for the trigger set definition. The **ON** event will be sent when the polling daemon is started and the **OFF** when it is stopped. These events can be used to powering up/down and initializing devices.

### 25.2. OpenNMS Configuration

**IFTTT** alarm polling will be enabled by setting the attribute `enabled` to `true` in the `ifttt-config.xml` file. It is also possible to configure the polling interval. The following trigger package defined the trigger sets which itself define a sequence of events to be triggered at **IFTTT**. Each trigger defines the `eventName` and an additional delay. This allows to defer the execution of the next trigger in a trigger set.

### 25.3. Example

The following example shows the configuration file for a WiFi light bulb controlled via **IFTTT**. The defined applets use `value1` for setting the color and `value2` for setting the brightness. The third value demonstrate the use of placeholders. For the severity-based trigger sets the following placeholders can be used in the three value fields: `%os%/oldSeverity` for old severity, `%ns%/newSeverity` for new severity, `%oc%/oldCount` for old alarm count and `%nc%/newCount` for new alarm count. This is useful for sending messages or operating LED displays via **IFTTT**.

```xml
<ifttt-config enabled="true" key="X71dfUZsH4Wkl6cJsLjdV" pollInterval="30">
<trigger-package categoryFilter="Routers|Switches" reductionKeyFilter=".*" onlyUnacknowledged="true">
  <trigger-set name="ON">
    <trigger eventName="on" delay="0">
      <value1/>
      <value2/>
      <value3/>
    </trigger>
  </trigger-set>

  <trigger-set name="OFF">
    <trigger eventName="off" delay="0">
      <value1/>
      <value2/>
      <value3/>
    </trigger>
  </trigger-set>
</trigger-package>
</ifttt-config>
```
<trigger-set name="NORMAL">
  <trigger eventName="OpenNMS" delay="0">
    <value1>#336600</value1>
    <value2>0.40</value2>
    <value3>%os%,%ns%,%oc%,%nc%</value3>
  </trigger>
</trigger-set>

<trigger-set name="WARNING">
  <trigger eventName="OpenNMS" delay="0">
    <value1>#FFCC00</value1>
    <value2>0.50</value2>
    <value3>%os%,%ns%,%oc%,%nc%</value3>
  </trigger>
</trigger-set>

<trigger-set name="MINOR">
  <trigger eventName="OpenNMS" delay="0">
    <value1>#FF9900</value1>
    <value2>0.60</value2>
    <value3>%os%,%ns%,%oc%,%nc%</value3>
  </trigger>
</trigger-set>

<trigger-set name="MAJOR">
  <trigger eventName="OpenNMS" delay="0">
    <value1>#CC3300</value1>
    <value2>0.70</value2>
    <value3>%os%,%ns%,%oc%,%nc%</value3>
  </trigger>
</trigger-set>

<trigger-set name="CRITICAL">
  <trigger eventName="OpenNMS" delay="0">
    <value1>#FF0000</value1>
    <value2>0.80</value2>
    <value3>%os%,%ns%,%oc%,%nc%</value3>
  </trigger>
</trigger-set>
</trigger-package>
Chapter 26. DNS Resolver

The DNS Resolver is used internally by OpenNMS modules and functions to provide lookup functionality as required.

26.1. Modules that use DNS Resolution

- TelemetryD

26.2. Configuring DNS Resolution

In order to customize the DNS servers that are queried, the following commands can be used:

```bash
$ ssh -p 8201 admin@localhost
...
admin@minion()> config:edit org.opennms.features.dnsresolver.netty
admin@minion()> property-set nameservers 8.8.8.8,4.2.2.2:53,[:1]:5353
admin@minion()> property-set query-timeout-millis 5000
admin@minion()> property-set max-cache-size 10000
admin@minion()> config:update
```

If no nameservers are set (or set to an empty string), the servers configured by the system running the JVM will be used.

The resolved host names are cached for their TTL as specified in the returned DNS records. TTL handling can be customized by setting the `min-ttl-seconds`, `max-ttl-seconds` and `negative-ttl-seconds` properties in the configuration above.

26.3. Configuring Circuit Breaker

Circuit Breaker functionality exist that helps prevent your DNS infrastructure from being flooded with requests when multiple failures occur. It is enabled by default but can be disabled by setting `breaker-enabled` to `false`.

Additional parameters can be modified to tune the functionality of the circuit breaker:

```bash
$ ssh -p 8201 admin@localhost
...
admin@minion()> config:edit org.opennms.features.dnsresolver.netty
admin@minion()> property-set breaker-enabled true
admin@minion()> property-set breaker-failure-rate-threshold 80
admin@minion()> property-set breaker-wait-duration-in-open-state 15
admin@minion()> property-set breaker-ring-buffer-size-in-half-open-state 10
admin@minion()> property-set breaker-ring-buffer-size-in-closed-state 100
admin@minion()> config:update
```
If the circuit breaker is disabled, the lookup statistics `lookupsSuccessful` and `lookupsFailed` are no longer tracked.

### 26.4. Configuring Bulkhead

A bulkhead is used to limit the number of concurrent DNS lookups that can be made.

Additional parameters can be modified to tune the functionality of the circuit breaker:

```
$ ssh -p 8201 admin@localhost
...
admin@minion()> config:edit org.opennms.features.dnsresolver.netty
admin@minion()> property-set bulkhead-max-concurrent-calls 1000
admin@minion()> property-set bulkhead-max-wait-duration-millis 5100
admin@minion()> config:update
```
Chapter 27. Telemetry Daemon

The telemetry daemon (telemetryd) provides an extensible framework you can use to handle sensor data pushed to OpenNMS Horizon. Use the framework to support applications that use different protocols to transfer metrics. With telemetryd, operators can define listeners supporting different protocols to receive the telemetry data and adapters transferring the received data into generic formats like flows or performance data.

Figure 41. Generic component overview of components in telemetryd

The configuration is split in two parts. Listeners and attached Parsers on one side, receive telemetry data transported over a specific protocol and parse the protocol according to its specification. On the other side, Adapters pick up the parsed data and enrich it before persisting it.

Queues transport the parsed telemetry data from Parsers to Adapters by binding a specific Parser to a specific Adapter.

27.1. Listeners and Parsers

Listeners receive sensor data from an external source and hand them off to Parsers, which handle the transport protocol format and extract the transported data.

A Listener does the transport protocol handling like opening a socket and accepting incoming connections. The received messages are then passed to the parser configured for the Listener which parses the concrete protocol implementation and extracts all available information out of the received message. For further processing, the extracted data is handed over to the configured queue.

For example: a Listener may open a UDP socket for receiving packets and an assigned Parser parses the incoming IPFIX packets.

Parsers and Listeners must work together closely. Therefore, they cannot be combined in any random way. Which Parser is supported by which Listener is described in the documentation of each respective Parser.

27.2. Adapters

Adapters enrich and process the data dispatched over a queue. They receive the data from queue and transform it into a format usable by OpenNMS Horizon. Adapters can also enrich the incoming data to attach node or interface information, depending on information already available.
For example: an Adapter may be used to transform telemetry data received via sFlow into performance data and persist it to the applicable node.

As an Adapter must handle data dependent to a transport protocol, not all Adapters can be used in combination with any possible Parser. Which Parsers are supported by which Adapters is described in the documentation of each respective Adapter.

If you have multiple Adapters, the execution order is the same as defined in the telemetryd-configuration.xml.

### 27.2.1. Working with Minions

Listeners and parsers run on Minion, but adapters do not. Adapters run on Sentinel, while the main OpenNMS Horizon instance can run listeners, parsers, and adapters. When using Minion as a listener, you must use adapters on OpenNMS Horizon or Sentinel to transform the data.

### 27.3. Queues

Queues transfer data between Parsers and Adapters and are represented by a channel in the messaging system.

#### 27.3.1. Configuring Queues

The following options can help fine-tune queue behavior:

<table>
<thead>
<tr>
<th>Queue attribute (OpenNMS)</th>
<th>Key (Minion/Sentinel)</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>threads</td>
<td>queue.threads</td>
<td>Number of threads used for consuming &amp; dispatching messages.</td>
<td>(2 * number of cores)</td>
</tr>
<tr>
<td>queue-size</td>
<td>queue.size</td>
<td>Maximum number of messages to keep in memory while waiting to be dispatched.</td>
<td>10000</td>
</tr>
<tr>
<td>use-routing-key</td>
<td>queue.use-routing-key</td>
<td>Whether to use the routing key when forwarding messages to the broker. This enforces ordering of the messages.</td>
<td>true</td>
</tr>
<tr>
<td>batch-size</td>
<td>batch.size</td>
<td>Messages are aggregated in batches before being dispatched. When the batch reaches this size, it will be dispatched.</td>
<td>1000</td>
</tr>
<tr>
<td>batch-interval</td>
<td>batch.interval</td>
<td>Messages are aggregated in batches before being dispatched. When the batch has been created for longer than this interval (ms) it will be dispatched, regardless of the current size.</td>
<td>500</td>
</tr>
</tbody>
</table>
When using Kafka as a message broker, setting use-routing-key to false allows the messages to be balanced across all partitions. This can be done safely for flows, but is not supported for metrics when using thresholding (order is required).

When setting these options in OpenNMS they can be added as an attribute to the <queue> element. For example:

```xml
<queue name="IPFIX" use-routing-key="false"/>
...
</queue>
```

When setting these options on Minion you can add them as parser properties, and on Sentinel as adapter properties:

```xml
name=IPFIX-Listener
class-name=org.opennms.netmgt.telemetry.listeners.UdpListener
parameters.host=0.0.0.0
parameters.port=4738
parsers.0.name=IPFIX
parsers.0.class-name=org.opennms.netmgt.telemetry.protocols.netflow.parser.IpfixUdpParser
parsers.0.queue.use-routing-key=false
```

### 27.4. Push Sensor Data through Minion

Listeners and their Parsers may run on either OpenNMS Horizon or Minion, whereas adapters run on OpenNMS Horizon or Sentinel. If a Listener and its Parsers are running on Minion, the received messages will be automatically dispatched to the associated Adapters running in OpenNMS Horizon or Sentinel via a Queue. Minions can listen (receive) data, but requires OpenNMS Horizon or Sentinel to process.

![Figure 42. Running Listener on a Minion forwarding packets using the messaging system](image)

### 27.5. Reverse hostname resolution

Some Parsers support reverse hostname resolution to annotate IP addresses with the actual hostname. The Minion performs the reverse name lookup while parsing the protocol data. The resolved hostname, if found, is attached to the address information and both are sent to the Adapter for further processing.
For more information see DNS Resolver

The following Parsers currently support reverse hostname resolution: Netflow v5, Netflow v9, IPFIX and sFlow.

27.6. Listener Reference

27.6.1. TCP Listener

The TCP Listener accepts incoming TCP connections and forwards the TCP stream to a single Parser.

Facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.telemetry.listeners.TcpListener</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported on Minion</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Parameters

Table 131. Listener-specific parameters for the TcpListener

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>IP address on which to bind the TCP port</td>
<td>optional</td>
<td>0.0.0.0</td>
</tr>
<tr>
<td>port</td>
<td>TCP port number on which to listen</td>
<td>optional</td>
<td>50000</td>
</tr>
</tbody>
</table>

27.6.2. UDP Listener

The UDP Listener can be used to open a UDP socket and forward the received packets to a Parser.

The UDP Listener can support multiple Parsers if all of these Parsers support protocol detection. If this is the case, each Parser defined for the Listener will be asked if it can handle the incoming packet. The first Parser that accepts the packet is then used to parse the packet and dispatch it to its Queue.

If only a single Parser is defined in the Listener, the packet is directly handed over for parsing.

Facts

<table>
<thead>
<tr>
<th>Class Name</th>
<th>org.opennms.netmgt.telemetry.listeners.UdpListener</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported on Minion</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Parameters

Table 132. Listener-specific parameters for the UdpListener
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>IP address on which to bind the UDP port</td>
<td>optional</td>
<td>0.0.0.0</td>
</tr>
<tr>
<td>port</td>
<td>UDP port number on which to listen</td>
<td>optional</td>
<td>50000</td>
</tr>
<tr>
<td>maxPacketSize</td>
<td>Maximum packet size in bytes (anything greater will be truncated)</td>
<td>optional</td>
<td>8096</td>
</tr>
</tbody>
</table>

27.7. Protocol Reference

27.7.1. BGP Monitoring Protocol

The *BGP Monitoring Protocol (BMP)* provides a convenient interface for obtaining route views. The integration in *OpenNMS Horizon* allows you to use these route views, status updates and statistics for monitoring and management.

*BMP integration overview*
**BMP TCP Parser**

The BMP Parser accepts BMP connections from router packets using a **TCP Listener**.

**Facts**

| Class Name | org.opennms.netmgt.telemetry.protocols.bmp.parser.BmpParser |

**Parameters**

*Table 133. Parameters for the BMP Parser*
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>dnsLookupsEnabled</td>
<td>Enable or disable DNS resolution of router and peer hostnames.</td>
<td>no</td>
<td>true</td>
</tr>
<tr>
<td>bulkhead.maxConcurrentCalls</td>
<td>Limits the number of parallel parsing operations.</td>
<td>no</td>
<td>1000</td>
</tr>
<tr>
<td>bulkhead.maxWaitDurationMs</td>
<td>Limits the amount of time to wait for a saturated bulkhead (in milliseconds).</td>
<td>no</td>
<td>5 Minutes</td>
</tr>
</tbody>
</table>

**Configure BMP Listener on a Minion**

To enable and configure a *TCP Listener* for BMP on Minion, connect to the *Karaf Console* and set the following properties:

```bash
$ ssh -p 8201 admin@localhost
...
admin@minion()> config:edit --alias tcp-5000 --factory org.opennms.features.telemetry.listeners
admin@minion()> config:property-set name BMP
admin@minion()> config:property-set class-name org.opennms.netmgt.telemetry.listeners.TcpListener
admin@minion()> config:property-set parameters.port 5000
admin@minion()> config:property-set parsers.0.name BMP
admin@minion()> config:property-set parsers.0.class-name org.opennms.netmgt.telemetry.protocols.bmp.parser.BmpParser
admin@minion()> config:update
```

The protocol must also be enabled on *OpenNMS Horizon* for the messages to be processed. If you do not specify the queue name, the fallback is the name of the parser.

**BMP Telemetry Adapter**

The BMP Telemetry Adapter handles *BMP* statistics received and parsed by the *BMP Parser*. Statistics received from the router are associated as performance data with that router. The router must exist as a regular node in *OpenNMS Horizon*.

OpenNMS Horizon uses the IP address exporting BMP messages to associate a router with the particular *OpenNMS Horizon* node. In addition, the node's metadata can specify a BGP ID, which will then be used to associate routers. If the parameter `metaDataNodeLookup` is not empty, it will be interpreted as a `context:key` metadata name, which will be used to lookup a node that has stored the queried BGP ID as a value in exactly this key.

**Facts**

| Class Name | org.opennms.netmgt.telemetry.protocols.bmp.adapter.BmpTelemetryAdapter |

---

466
Parameters

Table 134. Parameters for the BMP Telemetry Adapter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>metaDataNodeLookup</td>
<td>Enables lookup using BGP IDs.</td>
<td>no</td>
<td></td>
</tr>
</tbody>
</table>

BMP Peer Status Adapter

The BMP Peer Status Adapter creates events for peer status changes. It handles BMP Peer Up and Down messages that the BMP Parser receives and parses, and converts to OpenNMS Horizon events. OpenNMS Horizon associates the created events with the router sending the messages. This router must exist as regular node in OpenNMS Horizon.

The events are called uei.opennms.org/bmp/peerUp and uei.opennms.org/bmp/peerDown.

OpenNMS Horizon uses the IP address exporting BMP messages to associate a router with the particular OpenNMS Horizon node. In addition, the node's metadata can specify a BGP ID, which will then be used to associate routers. If the parameter metaDataNodeLookup is not empty, it will be interpreted as a context:key metadata name, which will be used to lookup a node that has stored the queried BGP ID as a value in exactly this key.

Facts

Class Name  |  org.opennms.netmgt.telemetry.protocols.bmp.adapter.BmpPeerStatusAdapter

Parameters

Table 135. Parameters for the BMP Telemetry Adapter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>metaDataNodeLookup</td>
<td>Enables lookup using BGP IDs.</td>
<td>no</td>
<td></td>
</tr>
</tbody>
</table>

OpenBMP Integration Adapter

The OpenBMP Integration Adapter integrates with an existing OpenBMP installation. It handles BMP messages the BMP Parser receives and parses, and creates OpenBMP-compatible messages, which are then passed to the OpenBMP Kafka cluster.

This setup replaces the Collector component of OpenBMP.

Facts

Class Name  |  org.opennms.netmgt.telemetry.protocols.bmp.adapter.openbmp.BmpIntegrationAdapter
Parameters

Table 136. Parameters for the OpenBMP Integration Adapter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>kafka.*</td>
<td>Uses options to create OpenBMP Kafka producer. Allows all known Kafka settings, but prefixed with kafka.</td>
<td>no</td>
<td></td>
</tr>
<tr>
<td>topicPrefix</td>
<td>Prefix used before each Kafka topic.</td>
<td>no</td>
<td></td>
</tr>
</tbody>
</table>

27.7.2. IPFIX

The IP Flow Information Export (IPFIX) protocol is a vendor-neutral standard for transmitting traffic flow information. See Flow Support for details on flow support in OpenNMS Horizon.

IPFIX UDP Parser

The IPFIX UDP Parser accepts packets received by a UDP Listener and must forward them to an IPFIX Adapter.

The IPFIX UDP Parser supports protocol detection.

Facts

| Class Name | org.opennms.netmgt.telemetry.protocols.netflow.parser.IpfixUdpParser |

Parameters

Table 137. Parameters for the IPFIX UDP Parser

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>templateTimeout</td>
<td>Templates must be redeclared in the given duration or they will be dropped.</td>
<td>no</td>
<td>30 minutes</td>
</tr>
<tr>
<td>maxClockSkew</td>
<td>The maximum delta in seconds between exporter and Minion timestamps.</td>
<td>no</td>
<td>0</td>
</tr>
<tr>
<td>clockSkewEventRate</td>
<td>Used to rate-limit clock skew events in seconds.</td>
<td>no</td>
<td>3600</td>
</tr>
<tr>
<td>dnsLookupsEnabled</td>
<td>Used to enable or disable DNS resolution for flows.</td>
<td>no</td>
<td>true</td>
</tr>
</tbody>
</table>

IPFIX TCP Parser

The IPFIX TCP Parser accepts packets received by a TCP Listener and must forward them to a IPFIX Adapter.
Facts

Class Name  org.opennms.netmgt.telemetry.protocols.netflow.parser.IpfixTcpParser

Parameters

This parser does not currently have any configurable parameters.

Configure IPFIX Listener on a Minion

To enable and configure a TCP Listener for IPFIX on Minion, connect to the Karaf Console and set the following properties:

```
$ ssh -p 8201 admin@localhost
...
admin@minion()> config:edit --alias tcp-50000 --factory org.opennms.features.telemetry.listeners
admin@minion()> config:property-set name IPFIX
admin@minion()> config:property-set class-name org.opennms.netmgt.telemetry.listeners.TcpListener
admin@minion()> config:property-set parameters.port 50000
admin@minion()> config:property-set parsers.0.name IPFIX
admin@minion()> config:property-set parsers.0.class-name org.opennms.netmgt.telemetry.protocols.netflow.parser.IpfixParser
admin@minion()> config:update
```

The protocol must also be enabled on OpenNMS Horizon for the messages to be processed. If you do not specify the queue name, the fallback is the name of the parser.

IPFIX Adapter

The IPFIX Adapter handles IPFIX telemetry data received and parsed by either of the IPFIX UDP Parser or IPFIX TCP Parser. Received flows are decoded from the messages into the canonical flow format and published to the flow repository.

Facts

Class Name  org.opennms.netmgt.telemetry.protocols.netflow.adapter.ipfix.IpfixAdapter

Parameters

Table 138. Parameters for the IPFIX TCP Parser

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>templatetimeout</td>
<td>Templates must be redeclared in the given duration or they will be dropped.</td>
<td>no</td>
<td>30 minutes</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Required</td>
<td>Default value</td>
</tr>
<tr>
<td>--------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>----------</td>
<td>---------------</td>
</tr>
<tr>
<td>maxClockSkew</td>
<td>The maximum delta in seconds between exporter and Minion time stamps.</td>
<td>no</td>
<td>0</td>
</tr>
<tr>
<td>clockSkewEventRate</td>
<td>Used to rate-limit clock skew events in seconds.</td>
<td>no</td>
<td>3600</td>
</tr>
<tr>
<td>dnsLookupsEnabled</td>
<td>Used to enable or disable DNS resolution for flows.</td>
<td>no</td>
<td>true</td>
</tr>
</tbody>
</table>

The parameter `maxClockSkew` in your parser definition enables clock skew detection for exporters. It specifies the maximum delta in seconds between exporter and Minion timestamps. If exceeded, an alarm will be generated for the exporting device. The default value is 0, so clock skew detection is disabled. Furthermore, a parameter `clockSkewEventRate` can be used to rate-limit clock skew events. The default is 3600 seconds, so every hour an event will be sent.

### 27.7.3. Junos Telemetry Interface

The *Junos Telemetry Interface (JTI)* allows users to push operational statistics asynchronously to *OpenNMS Horizon*. *OpenNMS Horizon* sends a request to stream periodic updates once to the device. Data is generated as Google protocol buffers (gpb) structured messages over *UDP*. For detailed information about *JTI*, see the [Juniper Documentation](#).

To enable support for *JTI*, edit `$(OPENNMS_HOME)/etc/telemetryd-configuration.xml` set `enabled=true` for *JTI* protocol.
Enable JTI protocol in telemetryd-configuration.xml

```xml
<listener name="JTI-UDP-50000" class-name="org.opennms.netmgmt.telemetry.listeners.simple.Udp" enabled="false">
  <parameter key="port" value="50000"/>

  <parser name="JTI-Parser" class-name="org.opennms.netmgmt.telemetry.protocols.common.parser.ForwardParser" queue="JTI"/>
</listener>

<queue name="JTI">
  <adapter name="JTI-GPB" class-name="org.opennms.netmgmt.telemetry.protocols.jti.adapter.JtiGpbAdapter" enabled="false">
    <parameter key="script" value="${install.dir}/etc/telemetryd-adapters/junos-telemetry-interface.groovy"/>

    <package name="JTI-Default">
      <rrd step="300">
        <rra>RRA:AVERAGE:0.5:1:2016</rra>
        <rra>RRA:AVERAGE:0.5:12:1488</rra>
        <rra>RRA:AVERAGE:0.5:288:366</rra>
        <rra>RRA:MAX:0.5:288:366</rra>
        <rra>RRA:MIN:0.5:288:366</rra>
      </rrd>
    </package>
  </adapter>
</queue>
```

Apply the changes without restarting by sending a `reloadDaemonConfig` event in the CLI or the Web UI:

**Send a reloadDaemonConfig event through CLI**

```
${OPENNMS_HOME}bin/send-event.pl -p 'daemonName Telemetryd'
uei.opennms.org/internal/reloadDaemonConfig
```

By default, this will open a UDP socket bound to `0.0.0.0:50000` to which JTI messages can be forwarded.

**Configure JTI Listener on a Minion**

To enable and configure a UDP Listener for JTI on Minion, connect to the Karaf Console and set the following properties:
$ ssh -p 8201 admin@localhost
...
admin@minion()> config:edit --alias udp-50000 --factory
org.opennms.features.telemetry.listeners
admin@minion()> config:property-set name JTI
admin@minion()> config:property-set class-name
org.opennms.netmgt.telemetry.listeners.UdpListener
admin@minion()> config:property-set parameters.port 50000
admin@minion()> config:property-set parsers.0.name JTI
admin@minion()> config:property-set parsers.0.class-name
org.opennms.netmgt.telemetry.protocols.common.parser.ForwardParser
admin@minion()> config:update

The protocol must also be enabled on OpenNMS Horizon for the messages to be processed.

JTI Adapter

The JTI adapter handles Junos Telemetry Interface payloads. Messages are decoded using the published protobuf specifications and forwarded to a JSR-223-compatible script (i.e., Beanshell or Groovy) for further processing. Use the script extension to extract the desired metrics from the JTI messages and persist the results as time series data.

Facts

| Class Name | org.opennms.netmgt.telemetry.protocols.jti.adapter.JtiGpbAdapter |

Parameters

Table 139. Adapter specific parameters for the JtiGpbAdapter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>script</td>
<td>Full path to the script used to handle the JTI messages</td>
<td>required</td>
<td>(none)</td>
</tr>
</tbody>
</table>

Scripting

The script will be invoked for every JTI message that is received and successfully decoded.

The following globals will be passed to the script:

Table 140. Globals passed to the script

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>

</tr>
</tbody>
</table>
27.7.4. NetFlow v5

See Flow Support for details on flow support in OpenNMS Horizon.

Netflow v5 UDP Parser

The Netflow v5 UDP Parser accepts packets received by a UDP Listener and must forward them to a Netflow v5 Adapter.

The Netflow v5 UDP Parser supports protocol detection.

Facts

| Class Name | org.opennms.netmgmt.telemetry.protocols.netflow.parser.Netflow5UdpParser |

Parameters

Table 141. Parameters for the Netflow v5 UDP Parser

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxClockSkew</td>
<td>The maximum delta in seconds between exporter and Minion timestamps.</td>
<td>no</td>
<td>0</td>
</tr>
<tr>
<td>clockSkewEventRate</td>
<td>Used to rate-limit clock skew events in seconds.</td>
<td>no</td>
<td>3600</td>
</tr>
<tr>
<td>dnsLookupsEnabled</td>
<td>Used to enable or disable DNS resolution for flows.</td>
<td>no</td>
<td>true</td>
</tr>
</tbody>
</table>

Netflow v5 Adapter

The Netflow v5 Adapter is used to handle Netflow v5 payloads received and parsed by by the Netflow v5 UDP Parser. Flows are decoded from the messages into the canonical flow format and are published to the flow repository

Facts

| Class Name | org.opennms.netmgmt.telemetry.protocols.netflow.adapter.netflow5.Netflow5Adapter |
Parameters

This adapter does not currently have any configurable parameters.

27.7.5. NetFlow v9

See Flow Support for details on flow support in OpenNMS Horizon.

Netflow v9 UDP Parser

The Netflow v9 UDP Parser accepts packets received by a UDP Listener and must forward them to a Netflow v9 Adapter.

The Netflow v9 UDP Parser supports protocol detection.

Facts

| Class Name                                      | org.opennms.netmgt.telemetry.protocols.netflow.parser.Netflow9UdpParser |

Parameters

Table 142. Parameters for the Netflow v9 UDP Parser

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>templateTimeou</td>
<td>Templates must be re-declared in the given duration or they will be dropped.</td>
<td>no</td>
<td>30 minutes</td>
</tr>
<tr>
<td>maxClockSkew</td>
<td>The maximum delta in seconds between exporter and Minion timestamps.</td>
<td>no</td>
<td>0</td>
</tr>
<tr>
<td>clockSkewEvent Rate</td>
<td>Used to rate-limit clock skew events in seconds.</td>
<td>no</td>
<td>3600</td>
</tr>
<tr>
<td>dnsLookupsEnabled</td>
<td>Used to enable or disable DNS resolution for flows.</td>
<td>no</td>
<td>true</td>
</tr>
</tbody>
</table>

Netflow v9 Adapter

The Netflow v9 Adapter is used to handle Netflow v9 payloads received and parsed by the Netflow v9 UDP Parser. Flows are decoded from the messages into the canonical flow format and are published to the flow repository.

Facts

| Class Name                                      | org.opennms.netmgt.telemetry.protocols.netflow.adapter.netflow9.Netflow9Adapter |

Parameters

This adapter does not currently have any configurable parameters.
The parameter `maxClockSkew` in your parser definition enables clock skew detection for exporters. It specifies the maximum delta in seconds between exporter and Minion time stamps. If exceeded, an alarm will be generated for the exporting device. The default value is 0, so clock skew detection is disabled. Furthermore, a parameter `clockSkewEventRate` can be used to rate-limit clock skew events. The default is 3600 seconds, so every hour an event will be sent.

### 27.7.6. Cisco NX-OS Telemetry

The *Cisco NX-OS Telemetry* allows to push operational statistics asynchronously to *OpenNMS Horizon*. *OpenNMS Horizon* sends a request to stream periodic updates once to the device. Data is generated as Google protocol buffers (gpb) structured messages over *UDP*. Detailed information about *NX-OS* can be found in [*NXOS Documentation*](#).

To enable support for *NX-OS Telemetry*, edit `${OPENNMS_HOME}/etc/telemetryd-configuration.xml` set `enabled=true` for *NXOS* protocol.

**Enable NX-OS protocol in telemetryd-configuration.xml**

```xml
<listener name="NXOS-UDP-50001" class-name="org.opennms.netmgmt.telemetry.listeners.simple.Udp" enabled="false">
  <parameter key="port" value="50001"/>

  <parser name="NXOS-GPB" class-name="org.opennms.netmgmt.telemetry.protocols.common.parser.ForwardParser" queue="NXOS"/>
</listener>

<queue name="NXOS">
  <adapter name="NXOS-GPB" class-name="org.opennms.netmgmt.telemetry.protocols.nxos.adapter.NxosGpbAdapter" enabled="false">
    <parameter key="script" value="${install.dir}/etc/telemetryd-adapters/cisco-nxos-telemetry-interface.groovy"/>

    <package name="NXOS-Default">
      <rrd step="300">
        <rra>RRA:AVERAGE:0.5:1:2016</rra>
        <rra>RRA:AVERAGE:0.5:12:1488</rra>
        <rra>RRA:AVERAGE:0.5:288:366</rra>
        <rra>RRA:MAX:0.5:288:366</rra>
        <rra>RRA:MIN:0.5:288:366</rra>
      </rrd>
    </package>
  </adapter>
</queue>
```

Apply the changes without restarting by sending a `reloadDaemonConfig` event in the CLI or the WebUI:
Send a reloadDaemonConfig event through CLI

```
${OPENNMS_HOME}bin/send-event.pl -p 'daemonName Telemetryd'
uei.opennms.org/internal/reloadDaemonConfig
```

By default, this will open a UDP socket bound to `0.0.0.0:50001` to which NXOS messages can be forwarded.

Configure NX-OS Listener on a Minion

To enable and configure an *UDP Listener* for NX-OS on Minion, connect to the *Karaf Console* and set the following properties:

```
$ ssh -p 8201 admin@localhost
...
admin@minion()> config:edit --alias udp-50001-nxos --factory
org.opennms.features.telemetry.listeners
admin@minion()> config:property-set name NXOS
admin@minion()> config:property-set class-name
org.opennms.netmgt.telemetry.listeners.UdpListener
admin@minion()> config:property-set parameters.port 50001
admin@minion()> config:property-set parsers.0.name NXOS
admin@minion()> config:property-set parsers.0.class-name
org.opennms.netmgt.telemetry.protocols.common.parser.ForwardParser
admin@minion()> config:update
```

The protocol must also be enabled on *OpenNMS Horizon* for the messages to be processed.

Cisco NX-OS Adapter

The NX-OS adapter is used to handle *Cisco NX-OS Telemetry* payloads. Messages are decoded using the published protobuf (proto3) specifications and forwarded to a JSR-223 compatible script (i.e. Beanshell or Groovy) for further processing. Using the script extension you can extract the desired metrics from the NX-OS messages and persist the results as time series data.

Facts

| Class Name | org.opennms.netmgt.telemetry.protocols.nxos.adapter.NxosGpbAdapter |

Parameters

*Table 143. Adapter specific parameters for the NxosGpbAdapter*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>script</td>
<td>Full path to the script used to handle the NXOS messages</td>
<td>required</td>
<td>(none)</td>
</tr>
</tbody>
</table>
Scripting

The script will be invoked for every NX-OS message that is received and successfully decoded.

The following globals will be passed to the script:

*Table 144. Globals passed to the script*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>
<td>The agent (node) against which the metrics will be associated</td>
<td>org.opennms.netmgt.collection.api.CollectionAgent</td>
</tr>
<tr>
<td>builder</td>
<td>Builder in which the resources and metrics should be added</td>
<td>org.opennms.netmgt.collection.support.builder.CollectionSetBuilder</td>
</tr>
<tr>
<td>msg</td>
<td>Decoded NX-OS message from which the metrics should be extracted</td>
<td>org.opennms.netmgt.telemetry.adapters.nxos.proto.TelemetryBis</td>
</tr>
</tbody>
</table>

27.7.7. sFlow

sFlow is capable of transporting both, telemetry data and flow information. *OpenNMS Horizon* can utilize both data types and extract and persist accordingly.

See [Flow Support](#) for details on flow support in *OpenNMS Horizon*.

sFlow UDP Parser

The sFlow UDP Parser accepts packets received by a [UDP Listener](#) and must forward them to a [sFlow Adapter](#).

The sFlow UDP Parser supports protocol detection.

**Facts**

| Class Name | org.opennms.netmgt.telemetry.protocols.sflow.parser.SFlowUdpParser |

**Parameters**

*Table 145. Parameters for the Netflow v5 UDP Parser*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>dnsLookupsEnabled</td>
<td>Used to enable or disable DNS resolution for flows.</td>
<td>no</td>
<td>true</td>
</tr>
</tbody>
</table>

sFlow Adapter

The sFlow Adapter is used to handle sFlow data received and parsed by the sFlow Parser. Flows are decoded from the messages into the canonical flow format and are published to the flow repository.
**Facts**

Class Name | org.opennms.netmgt.telemetry.protocols.sflow.adapter.SFlowAdapter

**Parameters**

This adapter does not currently have any configurable parameters.

**sFlow Telemetry Adapter**

The sFlow Telemetry Adapter is used to handle sFlow telemetry data received and parsed by the sFlow UDP Parser. The telemetry data is forwarded to a JSR-223 compatible script (i.e. Beanshell or Groovy) for further processing. Using the script extension you can extract the desired metrics from the sFlow messages and persist the results as time series data.

**Facts**

Class Name | org.opennms.netmgt.telemetry.protocols.sflow.adapter.SFlowTelemetryAdapter

**Parameters**

*Table 146. Adapter specific parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>script</td>
<td>Full path to the script used to handle the sFlow messages</td>
<td>required</td>
<td>(none)</td>
</tr>
</tbody>
</table>

**Scripting**

The script will be invoked for every sFlow (extended) counter sample that is received.

The following globals will be passed to the script:

*Table 147. Globals passed to the script*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>
<td>The agent (node) against which the metrics will be associated</td>
<td>org.opennms.netmgt.collection.api.CollectionAgent</td>
</tr>
<tr>
<td>builder</td>
<td>Builder in which the resources and metrics should be added</td>
<td>org.opennms.netmgt.collection.support.builder.CollectionSetBuilder</td>
</tr>
<tr>
<td>msg</td>
<td>sFlow (extended) counter sample</td>
<td>dynamic Map</td>
</tr>
</tbody>
</table>

See sFlow Specification for the contained fields and their meaning.

**27.7.8. Graphite Telemetry**

The Graphite telemetry adapter allows you to push telemetry data over UDP to OpenNMS Horizon.
using the plaintext protocol.

To enable support for plaintext Graphite over UDP, edit 

\[
\text{${OPENNMS_HOME}/etc/telemetryd-configuration.xml}
\]

set \texttt{enabled=true} for the Graphite protocol.

**Enable Graphite protocol in telemetryd-configuration.xml**

```xml
<listener name="Graphite-UDP-2003" class-name="org.opennms.netmgt.telemetry.listeners.UdpListener" enabled="true">
  <parameter key="port" value="2003"/>
  <parser name="Graphite-Parser" class-name="org.opennms.netmgt.telemetry.protocols.common.parser.ForwardParser" queue="Graphite"/>
</listener>

<queue name="Graphite">
  <adapter name="Graphite" class-name="org.opennms.netmgt.telemetry.protocols.graphite.adapter.GraphiteAdapter" enabled="true">
    <parameter key="script" value="/Users/ranger/git/opennms-work/target/opennms-26.1.3-SNAPSHOT/etc/telemetryd-adapters/graphite-telemetry-interface.groovy"/>
    <package name="Graphite-Default">
      <rrd step="300">
        <rra>RRA:AVERAGE:0.5:1:2016</rra>
        <rra>RRA:AVERAGE:0.5:12:1488</rra>
        <rra>RRA:AVERAGE:0.5:288:366</rra>
        <rra>RRA:MIN:0.5:288:366</rra>
      </rrd>
    </package>
  </adapter>
</queue>
```

Apply the changes without restarting by sending a reloadDaemonConfig event in the CLI or the WebUI:

**Send a reloadDaemonConfig event through CLI**

```
${OPENNMS_HOME}bin/send-event.pl -p 'daemonName Telemetryd' uei.opennms.org/internal/reloadDaemonConfig
```

By default, this will open a UDP socket bound to \texttt{0.0.0.0:2003} to which Graphite messages can be forwarded.

**Configure Graphite Listener on a Minion**

To enable and configure a UDP Listener for Graphite on Minion, connect to the Karaf Console and set the following properties:
The protocol must also be enabled on *OpenNMS Horizon* for the messages to be processed.

**Graphite Adapter**

The Graphite adapter is used to handle *Graphite* payloads. Messages are decoded and forwarded to a JSR-223 compatible script (i.e. Beanshell or Groovy) for further processing. Using the script extension you can extract the desired metrics from the Graphite messages and persist the results as time series data.

**Facts**

| Class Name | org.opennms.netmgt.telemetry.protocols.graphite.adapter.GraphiteAdapter |

**Parameters**

*Table 148. Adapter specific parameters for the GraphiteAdapter*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>script</td>
<td>Full path to the script used to handle the Graphite messages</td>
<td>required</td>
<td>(none)</td>
</tr>
</tbody>
</table>

**Scripting**

The script will be invoked for every Graphite message that is received and successfully decoded.

The following globals will be passed to the script:

*Table 149. Globals passed to the script*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>

</tbody>
</table>
Chapter 28. Elasticsearch Integration

OpenNMS Horizon persists/forwards certain data to Elasticsearch.

The following chapters describe the configuration possibilities as well as the available features.

Internally all Elasticsearch integrations use the Jest library to access the Elasticsearch ReST interface.

28.1. Configuration

The location of the configuration file depends on the feature. For flows, it can be found in $OPENNMS_HOME/etc/org.opennms.features.flows.persistence.elastic.cfg.

The following properties can be set:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Required</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>elasticUrl</td>
<td>URL(s) to Elasticsearch nodes. Can either point directly to ReST API or seed nodes. The format is: &lt;host&gt;:&lt;port&gt;. Comma separate multiple values.</td>
<td>required</td>
<td><a href="http://localhost:9200">http://localhost:9200</a></td>
</tr>
<tr>
<td>elasticIndexStrategy</td>
<td>Index strategy for data, allowed values yearly, monthly, daily, hourly</td>
<td>optional</td>
<td>daily</td>
</tr>
<tr>
<td>globalElasticUser</td>
<td>Username to use for all nodes, when X-Pack Security is configured.</td>
<td>optional</td>
<td>-</td>
</tr>
<tr>
<td>globalElasticPassword</td>
<td>Password to use for all nodes, when X-Pack Security is configured.</td>
<td>optional</td>
<td>-</td>
</tr>
<tr>
<td>ignoreCertificates</td>
<td>Set this to ignore HTTPS/SSL/TLS certificates.</td>
<td>optional</td>
<td>false</td>
</tr>
<tr>
<td>defaultMaxTotalConnections</td>
<td>Sets the default max connections per route. If a negative value is given, the value is ignored.</td>
<td>optional</td>
<td>&lt;available processors&gt; * 2</td>
</tr>
<tr>
<td>maxTotalConnections</td>
<td>Sets the default max total connections. If a negative value is given, the value is ignored.</td>
<td>optional</td>
<td>&lt;max connections per route&gt; * 3</td>
</tr>
<tr>
<td>nodeDiscovery</td>
<td>Enable/Disable node discovery. Valid values are true</td>
<td>false.</td>
<td>optional</td>
</tr>
<tr>
<td>nodeDiscoveryFrequency</td>
<td>Defines the frequency in seconds in which the nodes are re-discovered. Must be set, if discovery=true</td>
<td>optional</td>
<td>-</td>
</tr>
<tr>
<td>proxy</td>
<td>Allows defining a HTTP proxy. Only accepts valid URLs.</td>
<td>optional</td>
<td>-</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
<td>Required</td>
<td>default</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------</td>
<td>---------</td>
</tr>
<tr>
<td><code>httpCompression</code></td>
<td>Allows the use of HTTP compression.</td>
<td>optional</td>
<td>-</td>
</tr>
<tr>
<td><code>retries</code></td>
<td>Defines how many times an operation is retried before considered failed.</td>
<td>optional</td>
<td>0</td>
</tr>
<tr>
<td><code>retryCooldown</code></td>
<td>Defines the cooldown in ms to wait before retrying. Value of 0 means no cooldown. Value must be &gt;= 0.</td>
<td>optional</td>
<td>500</td>
</tr>
<tr>
<td><code>connTimeout</code></td>
<td>Defines the connection timeout in ms.</td>
<td>optional</td>
<td>5000</td>
</tr>
<tr>
<td><code>readTimeout</code></td>
<td>Defines the read timeout in ms.</td>
<td>optional</td>
<td>30000</td>
</tr>
<tr>
<td><code>bulkRetryCount</code></td>
<td>Defines the number of retries performed before a bulk operation is considered as failed. When bulk operations fail, only the failed items are retried.</td>
<td>optional</td>
<td>5</td>
</tr>
<tr>
<td><code>settings.index.number_of_shards</code></td>
<td>The number of primary shards that an index should have. Refer to Elasticsearch Reference → Index Modules for more details.</td>
<td>optional</td>
<td>-</td>
</tr>
<tr>
<td><code>settings.index.number_of_replicas</code></td>
<td>The number of replicas each primary shard has. Refer to Elasticsearch Reference → Index Modules for more details.</td>
<td>optional</td>
<td>-</td>
</tr>
<tr>
<td><code>settings.index.refresh_interval</code></td>
<td>How often to perform a refresh operation, which makes recent changes to the index visible to search. Refer to Elasticsearch Reference → Index Modules for more details.</td>
<td>optional</td>
<td>-</td>
</tr>
<tr>
<td><code>settings.index.routing_partition_size</code></td>
<td>The number of shards a custom routing value can go to. Refer to Elasticsearch Reference → Index Modules for more details.</td>
<td>optional</td>
<td>-</td>
</tr>
<tr>
<td><code>indexPrefix</code></td>
<td>Prefix is prepended to the index and template names. Can be used in cases where you want to share the same Elasticsearch cluster with many OpenNMS Horizon instances.</td>
<td>optional</td>
<td>-</td>
</tr>
</tbody>
</table>

- If a configuration management tool is used, the properties file can be created and is used as startup configuration.
- If credentials are provided preemptive auth is used for all defined Elasticsearch nodes.
Configuration Example to access Elasticsearch

```
elasticUrl=http://elastic:9200
elasticIndexStrategy=daily
globalElasticUser=elastic
globalElasticPassword=changeme
```

28.2. Credentials

It is possible to define credentials for each Elasticsearch node individually. Credentials for each node must be stored in `${OPENNMS_HOME}/etc/elastic-credentials.xml`.

Custom credentials

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<elastic-credentials>
  <credentials url="http://localhost:9200" username="ulf" password="ulf" />
  <credentials url="https://10.10.0.1:9333" username="ulf" password="flu" />
</elastic-credentials>
```

Credentials are globally defined and will be used by each feature.

28.3. Features

28.3.1. Feature Matrix

The following features leverage Elasticsearch and are compatible with version 7.x.x.

<table>
<thead>
<tr>
<th>Name</th>
<th>Enabled by default</th>
<th>Feature</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event and Alarm Forwarder</td>
<td>no</td>
<td>opennms-es-rest</td>
</tr>
<tr>
<td>Flow Support</td>
<td>yes</td>
<td>opennms-flows</td>
</tr>
<tr>
<td>Situation Feedback (ALEC)</td>
<td>no</td>
<td>opennms-situation-feedback</td>
</tr>
<tr>
<td>Alarm History</td>
<td>yes</td>
<td>opennms-alarm-history-elastic</td>
</tr>
</tbody>
</table>

28.3.2. Event Forwarder

The Event Forwarder (formerly known as the Elasticsearch ReST plugin) forwards events to Elasticsearch.

The events in Elasticsearch can then be used for indexing, long time archival, plotting with Grafana and browsing with Kibana.

This feature uses the Elasticsearch ReST interface and can interact with cloud-hosted Elasticsearch instances.
If you use *Kibana*, make sure you are using the version that is compatible with your version of *Elasticsearch*.

### Configuration

The configuration is held in `${OPENNMS_HOME}/etc/org.opennms.plugin.elasticsearch.rest.forwarder.cfg`. Please refer to section Configuring Elasticsearch in order to configure *Elasticsearch* connection settings.

Besides the general *Elasticsearch* connection settings, the following properties are supported to configure the *Event Forwarder*:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>logEventDescription</td>
<td>true</td>
<td>optional</td>
<td>Whether to forward the event description field to <em>Elasticsearch</em>. It can be disabled because it contains a long text field that can be redundant with the rest of the metadata included in the event.</td>
</tr>
<tr>
<td>archiveAssetData</td>
<td>true</td>
<td>optional</td>
<td>If true The following attributes representing useful node asset fields from the node asset table are included in archived events and alarms. These are included only where the values are not null or empty strings in the table. (asset-latitude, asset-longitude, asset-region, asset-building, asset-floor, asset-room, asset-rack, asset-slot, asset-port, asset-category, asset-displaycategory, asset-notifycategory, asset-pollercategory, asset-thresholdcategory, asset-managedobjecttype, asset-managedobjectinstance, asset-manufacturer, asset-vendor, asset-modelnumber, parent-nodelabel, parent-nodeid, parent-foreignsource, parent-foreignid)</td>
</tr>
<tr>
<td>groupOidParameters</td>
<td>false</td>
<td>optional</td>
<td>If true all oid from the event parameters are stored in a single array <code>p_oids</code> instead of a flattened structue.</td>
</tr>
<tr>
<td>logAllEvents</td>
<td>false</td>
<td>optional</td>
<td>If changed to true, then archive all events even if they have not been persisted in the <em>OpenNMS Horizon</em> database.</td>
</tr>
<tr>
<td>batchSize</td>
<td>200</td>
<td>optional</td>
<td>Increase this value to enable batch inserts into <em>Elasticsearch</em>. This is the maximum size of a batch of events that is sent to <em>Elasticsearch</em> in a single connection.</td>
</tr>
<tr>
<td>batchInterval</td>
<td>500</td>
<td>optional</td>
<td>The maximum time interval in milliseconds between batch events (recommended: 500ms) when a <code>batchSize</code> value greater than 1 is being used.</td>
</tr>
</tbody>
</table>

Once you are sure everything is correctly configured, you can activate the *Event Forwarder* by logging into the *OSGi* console and installing the feature: `opennms-es-rest`. 
OSGi login and installation of the Elasticsearch forwarder

```
ssh admin@localhost -p 8101
feature:install opennms-es-rest
```

Loading Historical Events

It is possible to load historical OpenNMS Horizon events into Elasticsearch from the OpenNMS Horizon database using a karaf console command. The command uses the OpenNMS Horizon Events ReST interface to retrieve a set number of historical events and forward them to Elasticsearch. Because we are using the ReST interface it is also possible to contact a remote OpenNMS Horizon and download its events into Elasticsearch by using the correct remote URL and credentials.

The following example sends historic events to Elasticsearch using the karaf console:

```
# open karaf command prompt using
# ssh -p 8101 admin@localhost
karaf> opennms:send-events-to-elasticsearch --username admin --password admin --url http://localhost:8980 --limit 10 --offset 0
```

For more details, consolidate the --help option of the command.

Index Definition

The index names used to store the events uses the following form: `opennms-raw-events-<index-strategy>/type/id`

For example (assuming an index strategy of monthly):

```
opennms-events-raw-2017-01/eventdata/11549
```

Viewing events using Kibana Sense

*Kibana Sense* is a Kibana app which allows you to run queries directly against Elasticsearch. ([https://www.elastic.co/guide/en/sense/current/installing.html](https://www.elastic.co/guide/en/sense/current/installing.html))

If you install *Kibana Sense* you can use the following commands to view the events sent to Elasticsearch. You should review the Elasticsearch ReST API documentation to understand how searches are specified. ([https://www.elastic.co/guide/en/elasticsearch/reference/current/search.html](https://www.elastic.co/guide/en/elasticsearch/reference/current/search.html))

Example searches to use in *Kibana Sense* (you can copy the whole contents of this panel into *Kibana Sense* as a set of examples)
Mapping of Events to Elasticsearch

Overview of index mapping

In OpenNMS Horizon, Event table entries contain references to associated node, asset, service and journal message tables. In Elasticsearch, we must flatten these entries into a single index entry for each insertion. Thus each index entry contains more context information than would be found in the actual OpenNMS Horizon event. This context information includes the associated node and asset table information which was current when (but may have changed since) the event was archived.

In the Table of Index Mappings below we have example event JSON entries retrieved using a sense command. The table helps illustrate how OpenNMS Horizon saves data in Elasticsearch.

Internal Elasticsearch fields always begin with an underscore character. The internal fields id, _index and _type are combined to give the unique identifier for an entry as described above under Index Definitions. All of the fields under _source represent the stored event (Elasticsearch documentation refers to source entries as indexed documents). The ID of each event is included in the _source id field and also duplicated in the internal _id.

Events in the OpenNMS Horizon events table (i.e. those corresponding to logs or traps) are copied directly to the opennms-events-raw- indexes. In OpenNMS Horizon events can contain parameters which are key-value pairs referencing additional data stored when the event is created. In Elasticsearch these parameters are always stored in separate fields in the index with names beginning with p_.

Events have severity fields defined as integers (long) and also corresponding severity_text fields which give the text equivalent (Critical, Major, Minor, Normal, Cleared).

Table of Index Mapping

The following table describes the mapping of simple OpenNMS Horizon events to the Raw Events Index. Note that fields that begin with an underscore (_) are internal to Elasticsearch.
<table>
<thead>
<tr>
<th>Event Field</th>
<th>Example Event JSON</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;_index&quot;:</td>
<td>&quot;_index&quot;: &quot;opennms-raw-events-2017.03&quot;,</td>
<td>string</td>
<td>_index is the index in which this event is stored.</td>
</tr>
<tr>
<td>&quot;_type&quot;:</td>
<td>&quot;_type&quot;: &quot;eventdata&quot;,</td>
<td>string</td>
<td>_type either alarmdata or eventdata</td>
</tr>
<tr>
<td>&quot;_id&quot;:</td>
<td>&quot;_id&quot;: &quot;1110&quot;,</td>
<td>string</td>
<td>_id field matches the event or alarm ID, if present.</td>
</tr>
<tr>
<td>&quot;_score&quot;:</td>
<td>&quot;_score&quot;: 1,</td>
<td>long</td>
<td>Internal Elasticsearch ranking of the search result.</td>
</tr>

</table>
### Event Index Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;nodesysname&quot;:</td>
<td>&quot;nodesysname&quot;: &quot;localhost.localdomain&quot;, string SNMP sysname of the node</td>
</tr>
<tr>
<td>&quot;qosalarmstate&quot;:</td>
<td>null, string SNMP qosarmstate of the node associated with the alarm or</td>
</tr>
</tbody>
</table>

### 28.3.3. Flow Support

*Flow Support* is described in detail [here](#).

When persisting flows into Elasticsearch, every flow is represented by a single document.

The following table describes a subset of the fields in the flow document:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>@timestamp</td>
<td>Timestamp in milliseconds at which the flow was sent by the exporter.</td>
</tr>
<tr>
<td>location</td>
<td>Monitoring location at which the flow was received. This will be Default</td>
</tr>
<tr>
<td>netflow.bytes</td>
<td>Number of bytes transferred in the flow.</td>
</tr>
<tr>
<td>netflow.last_switched</td>
<td>Timestamp in milliseconds at which the last packet of the flow was</td>
</tr>
<tr>
<td>netflow.direction</td>
<td>ingress or egress</td>
</tr>
<tr>
<td>netflow.first_switched</td>
<td>Timestamp in milliseconds at which the first packet of the flow was</td>
</tr>
<tr>
<td>netflow.input_snmp</td>
<td>SNMP interface index on which packets related to this flow were received.</td>
</tr>
<tr>
<td>netflow.output_snmp</td>
<td>SNMP interface index on which packets related to this flow were forwarded.</td>
</tr>
</tbody>
</table>

### 28.3.4. Situation Feedback

Full documentation on *Situation Feedback* is available [here](#).

When persisting Situation Feedback, feedback on each related alarm is represented by a document as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>@timestamp</td>
<td>Timestamp in milliseconds when the feedback was submitted.</td>
</tr>
<tr>
<td>situation_key</td>
<td>The reduction key of the situation.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>alarm_key</td>
<td>The reduction key of the related alarm.</td>
</tr>
<tr>
<td>feedback_type</td>
<td>One of CORRECT, FALSE_POSITIVE or FALSE_NEGATIVE</td>
</tr>
<tr>
<td>situation_fingerprint</td>
<td>A hash calculated on the situation when the feedback was submitted.</td>
</tr>
<tr>
<td>reason</td>
<td>A text string provided with the feedback.</td>
</tr>
<tr>
<td>user</td>
<td>The user that submitted the feedback.</td>
</tr>
</tbody>
</table>

### 28.3.5. Alarm History

See [Alarm History](#).
Chapter 29. Flow Support

29.1. Introduction

*OpenNMS Horizon* supports receiving, decoding and persisting flow information sent via *Netflow v5*, *Netflow v9*, *IPFIX* and *sFlow*. While flows offer a great breadth of information, the current focus of the support in *OpenNMS Horizon* is aimed at:

- Network diagnostic: Being able to view the top protocols and top talkers within the context of a particular network interface.
- Forensic analysis: Persisting the flows for long term storage.

29.1.1. How it works

At a high level:

- **telemetryd** is used to receive and decode flows on both *OpenNMS Horizon* and *Minion*.
- The *telemetryd* adapters convert the flows to a canonical flow model and dispatch these to the *flow repository*.
- The *flow repository* enriches the flows and persists them to *Elasticsearch*:
  - Flows are tagged with an application name via the *Classification Engine*.
  - Metadata related to associated nodes such as ids and categories are also added to the flows.
- The *REST API* supports generating both summaries and time series data from the flows stored in the *flow repository*.
- *OpenNMS Helm* is used to visualize the flow data using the *flow datasource* that interfaces with the *OpenNMS Horizon REST API*.

29.2. Setup

Here we assume that you already have:

- An Elasticsearch cluster setup with the *elasticsearch-drift-plugin* installed on every Elasticsearch node.
- An instance of Grafana *OpenNMS Helm* v2.0.0 or greater installed.

29.2.1. Configuration Elasticsearch persistence

From a Karaf shell on your *OpenNMS Horizon* instance, start by configuring the flow persistence to use your Elasticsearch cluster:
$ ssh -p 8101 admin@localhost
...
admin@opennms() > config:edit org.opennms.features.flows.persistence.elastic
admin@opennms() > config:property-set elasticUrl http://elastic:9200
admin@opennms() > config:update

This configuration is stored in `${OPENNMS_HOME/etc/org.opennms.features.flows.persistence.elastic.cfg`. See General Elasticsearch Configuration for a complete set of options.

29.2.2. Enabling a protocol

Next, enable one or more of the protocols you would like to handle in `${OPENNMS_HOME}/etc/telemetryd-configuration.xml`.

In this example we enable the NetFlow v5 protocol, but the same process can be repeated for any of the other flow related protocols.

Enable NetFlow v5 in telemetryd-configuration.xml

```xml
<listener name="Netflow-5-UDP-8877" class-name="org.opennms.netmgt.telemetry.listeners.UdpListener" enabled="true">
    <parameter key="port" value="8877"/>

    <parser name="Netflow-5-Parser" class-name="org.opennms.netmgt.telemetry.protocols.netflow.parser.Netflow5UdpParser" queue="Netflow-5" />
</listener>

<queue name="Netflow-5">
    <adapter name="Netflow-5-Adapter" class-name="org.opennms.netmgt.telemetry.protocols.netflow.adapter.netflow5.Netflow5Adapter" enabled="true">
    </adapter>
</queue>
```

Apply the changes without restarting by sending a `reloadDaemonConfig` event via the CLI:

Send a reloadDaemonConfig event through CLI

```plaintext
${OPENNMS_HOME}bin/send-event.pl -p 'daemonName Telemetryd'
uei.opennms.org/internal/reloadDaemonConfig
```

This will open a UDP socket bound to `0.0.0.0:8877` to which NetFlow v5 messages can be forwarded.
29.2.3. Linking to OpenNMS Helm in the Web UI

In order to access flow related graphs from the OpenNMS Horizon web interface, you must configure a link to your instance of OpenNMS Helm.

```
$ ssh -p 8101 admin@localhost
...
admin@opennms()> config:edit org.opennms.netmgt.flows.rest
admin@opennms()> config:property-set flowGraphUrl
'http://grafana:3000/dashboard/flows?node=$nodeId&interface=$ifIndex'
admin@opennms()> config:update
```

This URL can optionally point to other tools as well. It supports placeholders for $nodeId, $ifIndex, $start and $end.

Once configured, an icon will appear on the top right corner of a resource graph for an SNMP interface if there is flow data for that interface.

Configuring a listener on a Minion (Optional)

In this example we’ll look at enabling a generic listener for the NetFlow v5 protocol on Minion.

```
NetFlow v5 uses the generic UDP listener, but other protocols require a specific listener. See the examples in ${OPENNMS_HOME}/etc/telemetryd-configuration.xml, or Telemetryd Listener Reference for details.
```

To enable and configure a Listener for NetFlow v5 on Minion, connect to the Karaf Console and set the following properties:

```
$ ssh -p 8201 admin@localhost
...
admin@minion()> config:edit --alias udp-8877 --factory
org.opennms.features.telemetry.listeners
admin@minion()> config:property-set name Netflow-5
admin@minion()> config:property-set class-name
org.opennms.netmgt.telemetry.listeners.UdpListener
admin@minion()> config:property-set parameters.port 8877
admin@minion()> config:property-set parsers.0.name Netflow-5-Parser
admin@minion()> config:property-set parsers.0.class-name
org.opennms.netmgt.telemetry.protocols.netflow.parser.Netflow5UdpParser
admin@minion()> config:update
```

If a configuration management tool is used, the properties file can be created and is used as startup configuration in ${MINION_HOME}/etc/org.opennms.features.telemetry.listeners-udp-8877.cfg.
The associated protocol, in this case Netflow-5 must also be enabled on OpenNMS Horizon for the messages to be processed.

In some scenarios the exporters address is altered due to network address translation. In this case you can use node meta-data to identify the exporter. Use the metaDataNodeLookup parameter to specify a context-key pair in the form of context: key for the lookup.

This value used for the lookup corresponds to the following fields from the various protocols:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetFlow v5</td>
<td>engineId</td>
</tr>
<tr>
<td>NetFlow v9</td>
<td>sourceId</td>
</tr>
<tr>
<td>IPFix</td>
<td>observationDomainId</td>
</tr>
<tr>
<td>SFlow</td>
<td>agent_address:sub_agent_id</td>
</tr>
<tr>
<td>BMP</td>
<td>bgpId</td>
</tr>
</tbody>
</table>

### 29.2.4. Node cache configuration (Optional)

By default each Flow Document is - if known by OpenNMS Horizon - enriched with node information. To reduce the number of queries to the database, the data is cached.

The following cache properties are available to be set in `${OPENNMS_HOME/etc/org.opennms.features.flows.persistence.elastic.cfg`:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Required</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>nodeCache.maximumSize</td>
<td>The maximum size of the cache</td>
<td>false</td>
<td>1000</td>
</tr>
<tr>
<td>nodeCache.expireAfterWrite</td>
<td>Number of seconds until an entry in the node cache is evicted. Set to 0 to disable eviction.</td>
<td>false</td>
<td>300</td>
</tr>
<tr>
<td>nodeCache.recordStats</td>
<td>Defines if cache statistics are exposed via JMX. Set to false to disable statistic recording.</td>
<td>false</td>
<td>true</td>
</tr>
</tbody>
</table>

### 29.2.5. Classification Exporter Filter cache configuration (Optional)

A rule in the Classification Engine may define an exporterFilter. In order to resolve if the filter
criteria matches the address of an exporter a database query is executed. A cache can be configured to cache the result to improve performance.

The following cache properties are available to be set in `${OPENNMS_HOME/etc/org.opennms.features.flows.classification.cfg`:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Required</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>cache.classificationFilter.enabled</td>
<td>Enables or disables the cache.</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>cache.classificationFilter.maxSize</td>
<td>The maximum size of the cache</td>
<td>false</td>
<td>5000</td>
</tr>
<tr>
<td>cache.classificationFilter.expireAfterRead</td>
<td>Number of seconds until an entry in the node cache is evicted. Set to 0 to disable eviction. The timer is reset every time an entry is read.</td>
<td>false</td>
<td>300</td>
</tr>
<tr>
<td>nodeCache.recordStats</td>
<td>Defines if cache statistics are exposed via JMX. Set to false to disable statistic recording.</td>
<td>false</td>
<td>true</td>
</tr>
</tbody>
</table>

### 29.2.6. Configure Kafka forwarder

Enriched flows (with OpenNMS Node data) can also be forwarded to kafka.

Enriched flows are stored in `flowDocuments` topic and the payloads are encoded using Google Protocol Buffers (GPB). See `flowdocument.proto` in the corresponding source distribution for the model definitions.

Enable kafka forwarding:

```
$ ssh -p 8101 admin@localhost
...
admin@opennms()> config:edit org.opennms.features.flows.persistence.elastic
admin@opennms()> config:property-set enableForwarding true
admin@opennms()> config:update
```

Configure Kafka server for flows:

```
$ ssh -p 8101 admin@localhost
...
admin@opennms()> config:edit org.opennms.features.flows.persistence.kafka
admin@opennms()> config:property-set bootstrap.servers 127.0.0.1:9092
admin@opennms()> config:update
```

### 29.3. Classification Engine

The *Classification Engine* applies a set of user- and/or system-defined rules to each flow to classify it.
This allows users to group flows by applications, e.g. if all flows to port 80 are marked as http.

In order to classify a flow, a rule must be defined. A rule defines at least a name, which the flow is classified with, and additional parameters which must match for a successful classification.

### 29.3.1. Rule definition

A rule has the following fields:

<table>
<thead>
<tr>
<th>Name</th>
<th>Mandatory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group</td>
<td>mandatory</td>
<td>The group in which this rule was placed, e.g. system-defined, see also Rule Groups</td>
</tr>
<tr>
<td>position</td>
<td>mandatory</td>
<td>The position at which it is placed within its group, relevant for the Order of evaluation.</td>
</tr>
<tr>
<td>name</td>
<td>mandatory</td>
<td>The name the flow is classified with, e.g. http</td>
</tr>
<tr>
<td>dstPort</td>
<td>optional</td>
<td>The dstPort of the flow must match this port. May be a range or list of ports, e.g. 80,8080,8980, or 8000-9000.</td>
</tr>
<tr>
<td>dstAddress</td>
<td>optional</td>
<td>The dstAddress of the flow must match this address. May contain wildcards.</td>
</tr>
<tr>
<td>srcPort</td>
<td>optional</td>
<td>The srcPort of the flow must match this port. See dstPort for more details.</td>
</tr>
<tr>
<td>srcAddress</td>
<td>optional</td>
<td>The srcAddress of the flow must match this address. See dstAddress for more details.</td>
</tr>
<tr>
<td>exporterFilter</td>
<td>optional</td>
<td>The exporter of the flow must match this criteria. It supports all capabilities of the OpenNMS Horizon Filters API.</td>
</tr>
<tr>
<td>protocol</td>
<td>optional</td>
<td>The ip protocol of the flow must match this criteria.</td>
</tr>
</tbody>
</table>

Even if all fields (besides group, position and name) are optional, at least one of them must be defined to be considered a valid rule.

A list of pre-defined rules already exist in the group pre-defined. The pre-defined rules are inspired
by the IANA Service Name and Transport Protocol Port Number Registry. New rules can be defined using the Classification UI which can be found in the Admin Menu: Admin → Configure OpenNMS → Manage Flow Classification

29.3.2. Omnidirectional Rules

Rules can be marked as omnidirectional which additionally evaluates the rules with interchanged endpoint addresses and ports. This is helpful if traffic related to a matching classification should be classified the same way.

29.3.3. Rule Groups

Rules live within a rule group. New groups can be added, edited and deleted via the Classification UI. The pre-defined group is read only. It (and it’s rules) can not be altered.

29.3.4. Order of evaluation

Rules and groups have a position. Lower positions are evaluated first. The position of a rules group is more important than the rules position within its group. The system defined group is always evaluated last.

An example of an evaluation:

<table>
<thead>
<tr>
<th>Group Position</th>
<th>Group</th>
<th>Rule Position</th>
<th>Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>group 1</td>
<td>1</td>
<td>rule 1.1</td>
</tr>
<tr>
<td>1</td>
<td>group 1</td>
<td>2</td>
<td>rule 1.2</td>
</tr>
<tr>
<td>1</td>
<td>group 1</td>
<td>3</td>
<td>rule 1.3</td>
</tr>
<tr>
<td>1</td>
<td>group 1</td>
<td>4</td>
<td>rule 1.4</td>
</tr>
<tr>
<td>2</td>
<td>group 2</td>
<td>1</td>
<td>rule 2.1</td>
</tr>
<tr>
<td>2</td>
<td>group 2</td>
<td>2</td>
<td>rule 2.2</td>
</tr>
<tr>
<td>2</td>
<td>group 2</td>
<td>3</td>
<td>rule 2.3</td>
</tr>
<tr>
<td>2</td>
<td>group 2</td>
<td>4</td>
<td>rule 2.4</td>
</tr>
<tr>
<td>3</td>
<td>group 3</td>
<td>1</td>
<td>rule 3.1</td>
</tr>
<tr>
<td>3</td>
<td>group 3</td>
<td>2</td>
<td>rule 3.2</td>
</tr>
</tbody>
</table>

The positions of rules and groups can be changed by drag and drop or by editing the position field in the edit dialogs.

29.3.5. Verification

With a more complex set of rules it is not always easy to verify if everything is configured correctly. To make things a bit easier, the Classification UI allows to test/verify a classification. To do so, please navigate to the Classification UI: Admin → Configure OpenNMS → Manage Flow Classification and select the Test Classification action in the top right. This allows to simulate a flow being send to
the Classification Engine with certain fields.

29.3.6. Example

Let's assume the following rules are defined:

<table>
<thead>
<tr>
<th>name</th>
<th>srcAddress</th>
<th>srcPort</th>
<th>dstAddress</th>
<th>dstPort</th>
<th>protocol</th>
<th>exporterFilter</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpenNMS</td>
<td>10.0.0.1</td>
<td>8980</td>
<td></td>
<td></td>
<td>tcp,udp</td>
<td></td>
</tr>
<tr>
<td>http</td>
<td></td>
<td></td>
<td>80,8980,8080,9000</td>
<td></td>
<td>udp,tcp</td>
<td></td>
</tr>
<tr>
<td>https</td>
<td></td>
<td></td>
<td>443</td>
<td></td>
<td></td>
<td>categoryName == 'Exporters'</td>
</tr>
</tbody>
</table>

The following flows are sent to OpenNMS Horizon and with the rules defined above classified accordingly.

<table>
<thead>
<tr>
<th>Flow</th>
<th>Classification</th>
</tr>
</thead>
<tbody>
<tr>
<td>protocol: tcp, srcAddress: 10.0.0.5, srcPort: 60123, dstAddress: 54.246.188.65, dstPort: 80, exporterAddress: 10.0.0.55</td>
<td>http</td>
</tr>
<tr>
<td>protocol: tcp, srcAddress: 10.0.0.5, srcPort: 60123, dstAddress: 54.246.188.65, dstPort: 443, exporterAddress: 10.0.0.55</td>
<td>https</td>
</tr>
<tr>
<td>protocol: tcp, srcAddress: 10.0.0.5, srcPort: 60123, dstAddress: 10.0.0.1, dstPort: 8980, exporterAddress: 10.0.0.55</td>
<td>OpenNMS</td>
</tr>
</tbody>
</table>
29.4. Aggregation

The flow query engine supports rendering Top-N metrics from pre-aggregated documents stored in Elasticsearch. These can be used to help alleviate compute load on the Elasticsearch cluster, particularly for environments with large volumes of flows (>10,000 flows/sec).

In order to use this functionality you must enable the Kafka forwarder as described in [ga-flow-support-kafka-forwarder] and setup Nephron to process the flows.

Nephron currently requires an Apache Flink cluster to deploy the job.

The following properties can be set in `${OPENNS_HOME/etc/org.opennms.features.flows.persistence.elastic.cfg` to control the query engine to use aggregated flows:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Required</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>alwaysUseRawForQueries</td>
<td>Set to true to use raw flow documents to respond to all queries and effectively disable the use of aggregated flows.</td>
<td>false</td>
<td>true</td>
</tr>
<tr>
<td>alwaysUseAggForQueries</td>
<td>Set to true to use raw aggregated flow documents to respond to all queries and effectively disable the use of raw flows.</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>timeRangeDurationAggregateMs</td>
<td>Queries with time range filters that have a duration greater than this value will use aggregated flows when possible.</td>
<td>false</td>
<td>120000 (2 minutes)</td>
</tr>
<tr>
<td>timeRangeEndpointAggregateMs</td>
<td>Queries with time range filters that have an endpoint that is older than this value will use aggregated flows when possible.</td>
<td>false</td>
<td>604800000 (7 days)</td>
</tr>
</tbody>
</table>
Chapter 30. Kafka Producer

30.1. Overview

The Kafka Producer feature allows events, alarms, nodes, topologies and metrics from OpenNMS Horizon to be forwarded to Kafka.

These objects are stored in different topics and the payloads are encoded using Google Protocol Buffers (GPB). See opennms-kafka-producer.proto and collectionset.proto in the corresponding source distribution for the model definitions.

30.1.1. Events

The Kafka Producer listens for all events on the event bus and forwards these to a Kafka topic. The records are keyed by event id and contain a GPB encoded model of the event.

By default, all events are forwarded to a topic named events.

The name of the topic used can be configured, and an optional filtering expression can be set to help control which events are sent to the topic.

30.1.2. Alarms

The Kafka Producer listens for changes made to the current set of alarms and forwards the resulting alarms to a Kafka topic. The records are keyed by alarm reduction key and contain a GPB encoded model of the alarm. When an alarm is deleted, a null value is sent with the corresponding reduction key. Publishing records in this fashion allows the topic to be used as a KTable. The Kafka Producer will also perform periodic synchronization tasks to ensure that the contents of the Kafka topic reflect the current state of alarms in the OpenNMS Horizon database.

By default, all alarms (and subsequent updates) are forwarded to a topic named alarms.

The name of the topic used can be configured, and an optional filtering expression can be set to help control which alarms are sent to the topic.

30.1.3. Nodes

If an event or alarm being forwarded reference a node, then the corresponding node is also forwarded. The records are keyed by "node criteria" (see below) and contain a GPB encoded model of the alarm. A caching mechanism is in place to help avoid forwarding nodes that have been successfully forwarded, and have not changed since.

The name of the topic used can be configured.

⚠️ The node topic is not intended to include all of the nodes in the system, it only includes records for nodes that relate to events or alarms that have been forwarded.
Node Criteria

The *node criteria* is a string representation of the unique identifier for a given node. If the node is associated with a *foreign source* (*fs*) and *foreign id* (*fid*), the node criteria resulting node criteria will be the name of the *foreign source*, followed by a colon (:) and then the foreign id i.e. (*fs:*fid). If the node is not associated with both a *foreign source* and *foreign id*, then the node id (database id) will be used.

30.1.4. Topologies

The *Kafka Producer* listens for changes made to the current set of topologies (bridge, cdp, isis, lldp and ospf) and forwards the resulting messages to *Kafka* topics. A topic is defined either for Topology Vertex Update Message and another topic is defined for Topology Edge Update Message. The topologies are provided by the *enhanced linkd updaters* via the OnmsTopology API. An *Updater* send OnmsTopologyMessage to the subscribers. The records are keyed by *GPB* encoded key of protocol and TopologyRef and contain a *GPB* encoded model of the Vertex or Edge. When a Vertex or an Edge is deleted, a *null* value is sent with the corresponding encoded *GBP* key. Publishing records in this fashion allows the topic to be used as a *KTable*.

| ! | The topologies topic are not intended to include all of the vertices in the system, it only includes records for vertex that relate to topology messages that have been forwarded. |

30.1.5. Metrics

The *Kafka Producer* can be used to write metrics to *Kafka* either exclusively, or in addition to an existing persistence strategy i.e. RRD or Newts. The metrics are written in the form of "collection sets" which correspond to the internal representation used by the existing collectors and persistence strategies. The records are keyed by Node ID or by IP Address if no Node ID is available and contain a *GPB* encoded version of the collection sets. The records are keyed in this fashion to help ensure that collection sets related to the same resources are written to the same partitions.

When enabled (this functionality is disabled by default), the metrics are written to a topic named *metrics*.

| ! | When exclusively writing to *Kafka*, no metrics or resource graphs will be available on the *OpenNMS Horizon* instance. |

30.2. Enabling the Kafka Producer

The *Kafka Producer* is disabled by default and can be enabled as follows.

First, login to the *Karaf* shell of your *OpenNMS Horizon* instance and configure the *Kafka* client settings to point to your *Kafka* broker. See *Producer Configs* for a complete list of available options.
Next, install the `opennms-kafka-producer` feature from that same shell using:

```bash
admin@opennms()> feature:install opennms-kafka-producer
```

In order to ensure that the feature continues to be installed as subsequent restarts, add `opennms-kafka-producer` to the `featuresBoot` property in the `$OPENNMS_HOME/etc/org.apache.karaf.features.cfg`.

### 30.3. Configuring the Kafka Producer

The *Kafka Producer* exposes the following options to help fine tune its behavior.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>eventTopic</code></td>
<td><code>events</code></td>
<td>Name of the topic used for events. Set this to an empty string to disable forwarding events.</td>
</tr>
<tr>
<td><code>alarmTopic</code></td>
<td><code>alarms</code></td>
<td>Name of the topic used for alarms. Set this to an empty string to disable forwarding alarms.</td>
</tr>
<tr>
<td><code>alarmFeedbackTopic</code></td>
<td><code>alarmFeedback</code></td>
<td>Name of the topic used for alarm feedback. Set this to an empty string to disable forwarding alarm feedback.</td>
</tr>
<tr>
<td><code>nodeTopic</code></td>
<td><code>nodes</code></td>
<td>Name of the topic used for nodes. Set this to an empty string to disable forwarding nodes. Set this to an empty string to disable forwarding topologies.</td>
</tr>
<tr>
<td><code>topologyVertexTopic</code></td>
<td><code>vertices</code></td>
<td>Name of the topic used for topology vertices.</td>
</tr>
<tr>
<td><code>topologyEdgeTopic</code></td>
<td><code>edges</code></td>
<td>Name of the topic used for topology edges.</td>
</tr>
<tr>
<td><code>metricTopic</code></td>
<td><code>metrics</code></td>
<td>Name of the topic used for metrics.</td>
</tr>
<tr>
<td><code>eventFilter</code></td>
<td><code>-</code></td>
<td>A <em>Spring SpEL expression</em> (see below) used to filter events. Set this to an empty string to disable filtering, and forward all events.</td>
</tr>
<tr>
<td><code>alarmFilter</code></td>
<td><code>-</code></td>
<td>A <em>Spring SpEL expression</em> (see below) used to filter alarms. Set this to an empty string to disable filtering, and forward all alarms.</td>
</tr>
<tr>
<td><code>forward.metrics</code></td>
<td><code>false</code></td>
<td>Set this value to <code>true</code> to enable forwarding of metrics.</td>
</tr>
<tr>
<td>Name</td>
<td>Default Value</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>nodeRefreshTimeoutMs</td>
<td>300000 (5 minutes)</td>
<td>Number of milliseconds to wait before looking up a node in the database again. Decrease this value to improve accuracy at the cost of additional database look ups.</td>
</tr>
<tr>
<td>alarmSyncIntervalMs</td>
<td>300000 (5 minutes)</td>
<td>Number of milliseconds at which the contents of the alarm topic will be synchronized with the local database. Decrease this to improve accuracy at the cost of additional database look ups. Set this value to 0 to disable alarm synchronization.</td>
</tr>
<tr>
<td>suppressIncrementalAlarms</td>
<td>true</td>
<td>Suppresses forwarding alarms that differ only by count or last event time. Set this to false to prevent suppressing these alarms.</td>
</tr>
<tr>
<td>kafkaSendQueueCapacity</td>
<td>1000</td>
<td>The capacity for the queue of Kafka messages that is used when a Kafka message is pushed but Kafka is unavailable.</td>
</tr>
<tr>
<td>startAlarmSyncWithCleanState</td>
<td>false</td>
<td>Set this to true to force the Kafka Streams client to start with a clean state on every boot.</td>
</tr>
</tbody>
</table>

### 30.3.1. Configuring Filtering

Filtering can be used to selectively forward events and/or alarms to the Kafka topics.

Filtering is performed using a Spring SpEL expression which is evaluated against each object to determine if it should be forwarded. The expression must return a boolean value i.e. **true** or **false**.

#### Enabling Event Filtering

To enable event filtering, set the value of the `eventFilter` property to a valid SpEL expression.

```
$ ssh -p 8101 admin@localhost
...
admin@opennms()> config:edit org.opennms.features.kafka.producer
admin@opennms()> config:property-set eventFilter
'getUei().equals("uei.opennms.org/internal/discovery/newSuspect")'
admin@opennms()> config:update
```

In the example above, the filter is configured such that only events with the given **UEI** are forwarded. Consult the source code of the `org.opennms.netmgt.xml.event.OnmsEvent` class in your distribution for a complete list of available properties.

#### Enabling Alarm Filtering

To enable alarm filtering, set the value of the `alarmFilter` property to a valid SpEL expression.
In the example above, the filter is configured such that only alarms that are associated with a ticket id are forwarded. Consult the source code of the org.opennms.netmgt.model.OnmsAlarm class in your distribution for a complete list of available properties.

### 30.3.2. Enabling Metric Forwarding

To enable metric forward, set the value of the forward.metrics property to true.

```bash
$ ssh -p 8101 admin@localhost
...
admin@opennms()> config:edit org.opennms.features.kafka.producer
admin@opennms()> config:property-set forward.metrics true
admin@opennms()> config:update
```

#### Enabling Exclusive Metric Forwarding

Once metric forwarding is enabled, you can use this as the exclusive persistence strategy as follows by setting the following system property:

```bash
echo 'org.opennms.timeseries.strategy=osgi' > "$OPENNMS_HOME/etc/opennms.properties.d/kafka-for-metrics.properties"
```

### 30.3.3. Configuring Topic Names

By default five topics are created i.e. events, alarms, nodes, vertices, and edges. To change these, you can use:

```bash
$ ssh -p 8101 admin@localhost
...
admin@opennms()> config:edit org.opennms.features.kafka.producer
admin@opennms()> config:property-set eventTopic ""
admin@opennms()> config:property-set nodeTopic "opennms-nodes"
admin@opennms()> config:update
```

In the example above, we disable event forwarding by setting an empty topic name and change the node topic name to opennms-nodes.
In the example above, we set the vertex and edge topics to be different to default.

### 30.4. Shell Commands

The *Kafka Producer* also provides a series of shell commands to help administering and debugging the service.

#### 30.4.1. opennms:kafka-list-alarms

The `list-alarms` command can be used to enumerate the reduction keys and show the associated event labels for the alarms that are present in the topic. This command leverages functionality used by the alarm synchronization process, and as a result this must be enabled in for this command to function.

```bash
$ ssh -p 8101 admin@localhost
...
admin@opennms> opennms:kafka-list-alarms
uei.opennms.org/alarms/trigger:n33:0.0.0.0:HTTPS_POOLs
   Alarm: Generic Trigger
```

#### 30.4.2. kafka-producer:sync-alarms

The `sync-alarms` command can be used to manually trigger the alarm synchronization process.

```bash
$ ssh -p 8101 admin@localhost
...
admin@opennms> opennms:kafka-sync-alarms
Performing synchronization of alarms from the database with those in the ktable.
Executed 1 updates in 47ms.
Number of reduction keys in ktable: 4
Number of reduction keys in the db: 4 (4 alarms total)
Reduction keys added to the ktable: (None)
Reduction keys deleted from the ktable: (None)
Reduction keys updated in the ktable:
  uei.opennms.org/nodes/nodeLostService::1:127.0.0.1:Minion-RPC
```
30.4.3. opennms:kafka-evaluate-filter

The `evaluate-filter` command can be used to test arbitrary SpEL filtering expressions against alarms or events.

**Evaluating filters against alarms**

To test a filter against an alarm, specify the database id of the alarm and the expression to test:

```
admin@opennms> opennms:kafka-evaluate-filter --alarm-id 57
"getReductionKey().contains('n33')"
SPEL Expression: getReductionKey().contains('n33')
Alarm with ID 57 has reduction key:
uei.opennms.org/alarms/trigger:n33:0.0.0.0:HTTPS_POOLs
Result: true
```

**Evaluating filters against events**

To test a filter against an event, specify the UEI of the event and the expression to test:

```
admin@opennms> opennms:kafka-evaluate-filter --event-uei
uei.opennms.org/alarms/trigger "getUei().contains('alarm')"
SPEL Expression: getUei().contains('alarm')
Event has UEI: uei.opennms.org/alarms/trigger
Result: true
```

In this case, a new event will be created with the given UEI, and the filter will be evaluated against this new event object. At this time, existing events cannot be referenced by this tool, so this functionality only serves to help make sure the expressions are syntactically valid.
Chapter 31. Alarm Correlation

31.1. Situation Feedback

31.1.1. Introduction

Situation Feedback allows operators to provide real time feedback on Alarm Correlation.

31.1.2. Installation

Situation Feedback needs to be enabled by installing the feature from the Karaf shell:

```
feature:install opennms-situation-feedback
```

In order to ensure that the feature continues to be installed as subsequent restarts, add `opennms-situation-feedback` to the `featuresBoot` property in the `${OPENNMS_HOME}/etc/org.apache.karaf.features.cfg`.

31.1.3. Requirements

The feature requires Elasticsearch to persist the feedback records.

Configuration Elasticsearch persistence

From a Karaf shell on your `OpenNMS Horizon` instance, start by configuring the Situation Feedback persistence to use your Elasticsearch cluster:

```
$ ssh -p 8101 admin@localhost
...
admin@opennms()> config:edit org.opennms.features.situation-feedback.persistence.elastic
admin@opennms()> config:property-set elasticUrl http://elastic:9200
admin@opennms()> config:update
```

This configuration is stored in `${OPENNMS_HOME}/etc/org.opennms.features.situation-feedback.persistence.elastic.cfg`. See Elasticsearch Integration for more information.

Installing the feature exposes a ReST endpoint that `OpenNMS Helm` uses to display and submit feedback.

Further information on the ReST API can be found in the Developer Guide.
Chapter 32. Meta-Data

OpenNMS Horizon supports the assignment of arbitrary metadata to nodes, interfaces and services. You can then use this metadata to dynamically configure service monitoring, performance data collection, service detection, and expression-based thresholds.

The metadata is a simple triad of strings containing a context, a key and the associated value. Each node, each interface and each service can have an arbitrary number of metadata elements assigned to it. The only restriction is that the tuple of context and key must be unique in the element with which it is associated.

The association of metadata with nodes, interfaces and services happens during provisioning. Users can add, query, modify, or delete metadata through the requisition editor in the web UI, or through the REST endpoints.

A simple domain-specific language (DSL) allows users to access the metadata associated with the elements they are working on, and use it as a variable in parameters and expressions. There is no limitation in defining metadata: users can decide how to define it and use it in expressions.

View metadata currently assigned to nodes, interfaces and services, on the details page associated with that entity in the web UI:

[metadata view]

32.1. Contexts

A context distinguishes different kinds of metadata use. OpenNMS Horizon uses several default contexts: pattern (used with polling), requisition, node, interface, and service.

Three special contexts provide details about nodes, interfaces and services objects. Each context has keys associated with it that you can use in a metadata expression.

You can create user-defined contexts in the ReST API by prefixing the context name with X-. Using an X- prefix can help to avoid future OpenNMS Horizon contexts interfering with a user-defined context, since OpenNMS Horizon contexts are not prefixed in this way.

32.1.1. Node context

The node context provides details about the node currently processed. The following keys are available under this context:

<table>
<thead>
<tr>
<th>Context:Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>node:label</td>
<td>The node’s label</td>
</tr>
<tr>
<td>node:foreign-source</td>
<td>The node's foreign source name</td>
</tr>
<tr>
<td>node:foreign-id</td>
<td>The node’s foreign ID</td>
</tr>
<tr>
<td>node:netbios-domain</td>
<td>The NetBIOS domain as provided by SNMP</td>
</tr>
</tbody>
</table>
### 32.1.2. Interface context

The **interface** context provides details about the interface currently processed. The following keys are available under this context:

<table>
<thead>
<tr>
<th>Context:Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface:hostname</td>
<td>The hostname associated with the IP address of the interface</td>
</tr>
<tr>
<td>interface:address</td>
<td>The IP address of the interface</td>
</tr>
<tr>
<td>interface:netmask</td>
<td>The netmask of the interface</td>
</tr>
<tr>
<td>interface:if-index</td>
<td>The SNMP interface index</td>
</tr>
<tr>
<td>interface:if-alias</td>
<td>The SNMP interface alias</td>
</tr>
<tr>
<td>interface:if-description</td>
<td>The SNMP interface description</td>
</tr>
<tr>
<td>interface:phy-addr</td>
<td>The physical address of the interface</td>
</tr>
</tbody>
</table>

### 32.1.3. Service context

The **service** context provides details about the service currently processed. The following key is available under this context:

<table>
<thead>
<tr>
<th>Context:Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service:name</td>
<td>The full name of the service</td>
</tr>
</tbody>
</table>

### 32.2. Adding Metadata through the Web UI

You can edit the requisition context in the web UI:
1. Under the admin menu, select **Configure OpenNMS**.

2. Select **Manage Provisioning Requisitions**.

3. Click the edit icon beside the requisition you want to work with.

4. Click edit beside the node you want to work with.

5. In the **Meta-Data** area, click **Add Meta-Data**.

   [metadata add]

6. Specify **node** or **interface** as the **scope** of where the metadata will apply.

7. Specify the key and a value and click **Save**.

### 32.3. The Metadata DSL

The metadata DSL allows interpolation of metadata into a parameter. The syntax allows the use of patterns like `${context:key|context_fallback:key_fallback|…|default}` in an expression.

Each expression can contain multiple references to metadata that will be replaced with the corresponding value during evaluation. Placeholders start with `${` and end with `}` containing a reference to a context-key pair. You may choose to define multiple fallback context-key pairs and an optional trailing default value. Separate context and key by a `:`. Use a `|` to separate optional fallback context-key pairs and default value. If the first context:key item is not available (not on a service, interface, node or any other of the special contexts) the next one after the `|` is used. The last one, the default value, is not interpreted as a `context:key` but is used as a literal and will always succeed.

#### Examples

```bash
${requisition:username}
```

Will resolve to the **username** as defined in the requisitioning UI or an empty value, if there is no such username defined.

A placeholder can contain an optional default value which is separated by a `|`.

```bash
${requisition:username|admin}
```

Will resolve to the **username** as defined in the requisitioning UI or to the value **admin**, if there is no such username defined.

Use fallback context-key pairs in a placeholder after the primary context-key pair to specify other values if the primary context-key pair is not defined. Separate each fallback context-key-pair by a `|`.

```bash
${requisition:username|requisition:account|admin}
```

Will resolve to the **username** as defined in the requisitioning UI. If there is no such username defined, the fallback **account** will be used. If neither exist, the fallback value **admin** will be used.

To resolve the value associated with context-key pair, the DSL uses scopes that determine the resolution order. The last scope will be queried first and if a scope does not contain the queried context-key tuple, the next one will be queried. For example, the resolution of a query on a service
entity would be service metadata → interface metadata → node metadata. On an interface, it is metadata → interface metadata → node metadata. On the node level, only the node is queried.

Which scopes are available depends on the environment for which an expression is evaluated and is documented in the corresponding places elsewhere in this guide. Some environments also provide additional scopes that are not backed by the persisted metadata but provide additional metadata related to the current evaluation.

### 32.3.1. Testing an expression

To test an expression, there is a karaf shell command which interpolates a string containing a pattern to the final result:

```
admin@opennms> opennms:metadata-test -n 1 -i 192.168.0.100 -s ICMP '${fruits:apple|fruits:banana|vegetables:tomato|blue}'

---
Meta-Data for node (id=1)
fruits:
   apple='green'
   banana='yellow'
vegetables:
   tomato='red'
---
Meta-Data for interface (ipAddress=192.168.0.100):
fruits:
   apple='brown'
---
Meta-Data for service (name=ICMP):
fruits:
   apple='red'
---
Input: '${fruits:apple|fruits:banana|vegetables:tomato|blue}'
Output: 'red'
admin@opennms>
```

### 32.3.2. Uses

The following places allow the use the Metadata DSL:

- **Provisioning Detectors**
- **Service Assurance**
- **Performance Management**
- **TTLs with Minion**
- **Expression-Based Thresholds**
Chapter 33. OpenNMS Horizon Administration

This section describes administrative tasks, such as shutdown and restart, you may need to perform with your OpenNMS Horizon instance.

This chapter provides an example of the order to follow when shutting down and restarting a sample OpenNMS Horizon system: OpenNMS Horizon core layer, persistence and messaging layer, and database layer.

OpenNMS Restart Process

<table>
<thead>
<tr>
<th>Shutdown</th>
<th>Restart</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Dashboard layer</td>
<td>1. Persistence and Messaging layer (in any order)</td>
</tr>
<tr>
<td>2. OpenNMS layer (in any order)</td>
<td>2. OpenNMS layer (in any order)</td>
</tr>
<tr>
<td>3. Persistence and Messaging layer (in any order)</td>
<td>3. Dashboard layer</td>
</tr>
</tbody>
</table>

Note that restarting the whole stack is rare. Usually, restarting the OpenNMS Horizon core happens for reconfiguration or to run upgrades. A core restart takes between 2–5 minutes depending on memory configuration. Minion and Sentinel restart faster.

Keep in mind that when shutting down the OpenNMS Horizon core, there will be no notifications, alarms, outage detection, performance data collection, thresholding, or flows. After restarting there will be gaps in your performance graphs for the shutdown time.

Restarting components in the persistence and messaging layer normally happens only for upgrades or catastrophic failures. Exercise caution with restarting components in this layer, since there is the risk of data loss.

The steps below are illustrative for a sample Linux setup. Your OpenNMS Horizon may be different. Documenting procedures for each setup is beyond the scope of this document. You must be root to run the commands listed below.

33.1. Shutdown

Shutdown components in the following order:

1. Dashboard applications such as Grafana and Kibana.
2. OpenNMS Horizon Core application (Core, Sentinel, Minion), in any order.
   a. Turn off notifications first.
      i. Login to the OpenNMS Horizon UI.
      ii. In the top right corner choose User name → Configure OpenNMS:

         ![Configuration Menu]

      iii. Under Event Management, turn off Notification Status and click Update.

   b. Access the OpenNMS Horizon system via CLI (putty, SecureCRT, etc.).
   c. Become a root user via the following command: `sudo su -`
   d. Type the following commands:

      ```
      systemctl stop opennms
      systemctl stop minion
      systemctl stop sentinel
      ```

3. Persistence and messaging components such as PostgreSQL, Cassandra, Kafka, etc., in any order:

      ```
      systemctl stop postgresql-12
      systemctl stop cassandra
      systemctl stop elasticsearch
      ```

   ![Information]
   Neither Kafka nor Zookeeper have systemctl definitions. The way to control the processes depends on how they were installed, and is beyond the scope of this documentation.
33.2. Restart

Restart components in the following order:

1. Persistence and messaging components such as PostgreSQL, Cassandra, Kafka, etc., in any order:

   systemctl start postgresql-12
   systemctl start cassandra
   systemctl start elasticsearch

2. OpenNMS Horizon Core application second, in any order.

   systemctl start opennms
   systemctl start minion
   systemctl start sentinel

   a. In the UI, turn the Notification Status to **On** and click **Update**.

3. Dashboard applications like Grafana and Kibana last so they function properly.

   systemctl start grafana-server
   systemctl start kibana

---

You can restart dashboard applications at any time, but they will not show any useful information until all components in the persistence and OpenNMS Horizon layers have started.
